The greatest of Sir John's discoveries was in 1860. Returning from a trip on the Continent he came by way of Toulon, where the French ship *La Gloire* put into harbour. This was a timber-built 90-gun three-decker cut down into an "exaggerated corvette," with forty big guns, and hammered plate armour  $4\frac{1}{2}$  inches thick, 5 feet long and 2 feet wide. The British Admiralty were so uneasy at the action of the French Government in putting the *La Gloire* into commission that ten 90 and 100-gun timber-built ships were stopped in their progress in order to be cut down and plated like the French vessel. Sir John was not allowed on board, but after thoroughly examining the craft from the shore he came to the conclusion that the hammered-armour plates used in clothing her could be rolled. By this time he had become Mayor of Sheffield, and the fame of his works had induced Lord Palmerston, then the Premier, to visit the town as his guest. The Premier saw rolled a plate 3 feet 9 inches wide, 18 feet 6 inches long,  $5\frac{1}{2}$  inches thick and upwards of six tons weight. In the *Times* of August 11, 1862, the process was described in terms of wonderment as a great feat. In April of 1863 the Lords of the Admiralty, headed by the Duke of Somerset, visited Sheffield and witnessed the opening of a new rolling mill which the owner of the Atlas Works had put down. They saw several plates rolled from  $4\frac{1}{2}$  inches to  $5\frac{1}{2}$  inches thick and 40 feet long. At the close a plate 12 inches thick and 15 feet to 20 feet in length was rolled, and thus was practically demonstrated the great discovery which changed our ships from hearts of oak to masses of iron. The Duke of Somerset, after witnessing the operations of the new rolling mill, predicted that it would be one of the most wonderful pieces of machinery that had ever been made in this country. Armour-plates were perfected by their inventor with great enterprise. He was the first to roll plates of large dimensions, and he kept the lead to the last. In the great struggle of plates *versus* projectiles, he kept plates well to the front, and latterly they were rolled 24 inches thick. Now iron armour has been superseded by compound, *i.e.* steel-faced plates, and a new conflict has begun between English steel-faced and French all-steel armour, and these in their turn are being subjected to steel projectiles

chrome and other. The Royal Commission on Armour-plates rewarded Sir John by ordering nearly all the plates they required from his works, and in a few years he had sheathed fully three-fourths of the entire British Navy. His productions successfully encountered the shells of English and foreign makers.

Sir John's works increased until they gave employment to 4,000 artisans in the manufacture of armour-plates, ordnance forgings, railway bars, steel springs, buffers, tires, axles, &c. He was the first successfully to develop the Bessemer process and to introduce the manufacture of steel rails which are now, owing to modern competition and high railway rates, one of Sheffield's lost industries. In the first year of his business his turnover was 3,000/. During the year previous to its being converted into a limited company it was 3,000,000/. Foreign Governments, hearing of his great armour-plates, applied to him, but he refused to supply any other Power until he had obtained the consent of the home Government. While civil war raged in America he declined on this account large orders from the Northern States. The Russian Admiralty were equally anxious that he should make plates for them, and they got a similar answer.

He was knighted in 1867, and filled every office of honour his fellow-townpeople could confer upon him except the membership for the borough, which was offered to him while serving as mayor in 1863. He was twice mayor and twice Master Cutler. He was a J.P. and deputy-lieutenant of the West Riding. For the religious welfare of his workpeople he erected All Saints Church at a cost of 12,000/. Some time after his business was converted into a limited liability company Sir John retired from active participation, residing at Endcliffe Hall, Ranmoor, Sheffield.

### FRENCH GLASS.

In a certain sense glass-making is not only one of the oldest, but also one of the newest occupations. It is as old as the earliest civilisation, says a writer in the *Optician*, for in the most ancient ruins in Egypt and Mesopotamia are to be found articles of ornament and use made of glass. The secret of their manufacture has never been rediscovered, and none like them can be made. Glass objects have been found under circumstances and in places indicating that they were in use ere men had learned to manufacture iron into useful forms, and

if glass is coeval with bronze, why may it not also have existed in the age of stone? Glass-making is also one of the newest arts, for while well known in the most ancient times, its development was arrested, and until a century and a half ago little more skill was shown than was probably displayed by the glass-blowers of Egypt 4,000 years ago. As the industry now exists it is eminently of the present, and to the nineteenth century must be assigned nearly all the improvements which have placed glass-making so high among the fine arts. This period has been called the fruition of the age of iron, but quite as appropriately could it be termed the age of glass, for never before in the world's history did this material play so important a part in the life of civilised man, and so indispensable has it become that it is difficult to understand how our forefathers lived without it. Oiled paper was a poor substitute for window glass, and the dwellings, and even the palaces, of three or four centuries ago must have been to modern ideas very dark and dreary places. It protects the flame and lamp and gas jet; it furnishes us with mirrors compared with which the silver and bronze handglasses of ancient times were but dull; it gives us a thousand kinds of receptacles of all varieties and of almost every size, and in the arts it is indispensable, for without his glass apparatus what could the chemist do to penetrate the secrets of organic and inorganic nature? Without telescope and microscope the discoveries of the astronomer and the microscopist would be unknown.

To obtain entrance to a French glass factory is no easy matter, for every glass house has its secrets; and the first thing that occurs to the owner or superintendent when a stranger applies for admission is a strong suspicion that the would-be visitor is a disguised agent from some other glass house, and that his only business is to ascertain how some particular specialty is made, then go away, at once begin its manufacture and rob the establishment of its trade. Nor is it easy to disabuse the mind of the proprietor or his agent of this suspicion, for he has previously detected such spies, is on the look-out for crooked work of this kind, and is therefore disposed to keep strangers at a respectful distance. To obtain admission at all, the stranger must be introduced and identified by a friend of the manufacturer's, and even then, though he may never learn the fact, he may assume that the proprietor of the glass house, before admitting him, applies to the police to ascertain who he is and something of his antecedents. The suspicious proprietor and superintendent being satisfied, a card of admission is issued to the visitor, and he is admitted to the establishment, and is no sooner

## THE SOUTHAMPTON STEAM JOINERY CO., BELVEDERE WORKS, SOUTHAMPTON.

London Office: 11 Clement's Inn, Strand, W.C. Estimates supplied.

Manufacturers of JOINERY suitable for all purposes, from the Cottage to the highest class of Mansion and Public Building.

**IN HARD OR SOFT WOODS.**

Church, Bank, Office, Shop, Ship, Yacht and other Fittings. School Seats and Desks: Chimney-pieces. Horticultural Buildings, &c.

MOULDINGS, ELECTRIC LIGHT CABLE CASINGS AND COVERS.

STEAM SAWING, PLANING, AND MOULDING MILLS.

Joinery and Fittings have been manufactured at these Works (which are the largest in the South of England) for some of the most important buildings in this Country and Abroad.

fairly in than he is seized with an intense desire to get out again, for of all hot places upon this side of that region where the fire is not quenched a glass-house is the hottest. A foundry is an ice-house in comparison with it. A great room, with limited ventilation (for no currents of air can be allowed to pass freely through the factory where molten-glass is being handled), long rows of red-hot furnaces, the air seemingly on fire, great bursts of flame from the opening and closing doors of the kilns—the scene, especially at night, is lurid and almost terror-inspiring. An army of half-naked men, with long iron instruments, stirring the molten glass, withdrawing the bar with a ball of red hot glass, and blowing, drawing, moulding it into various shapes—the sight is appropriate to the super-heated chamber. These are the genii of the glass works, and their performances are more wonderful than those of the “Arabian Nights,” for at their touch the substance which is the very type and symbol of fragility becomes plastic, malleable, ductile. It is veritable magic, for, dipping his “canne” into the red-hot liquid, the blower quickly produces at the end a huge crystal sphere, as transparent as the purest water, and yet reflecting from its inner and outer surfaces every hue seen in the rainbow.

A pair of workmen simultaneously draw from the molten mass their instruments, with a glowing ball of double size; one walks away, carrying his “canne” over his shoulder, and between the two appears a red-hot rope of glass; longer and longer it grows, until the beholder looks for it to snap; it does not, but when drawn out many many feet, and to an equal thickness throughout, it is laid on a contrivance resembling a cross between a railroad and a ladder—and behold, a long glass tube, ready for use in the chemist’s laboratory. It is straight, but it does not need to be so; for at a touch the workman can make it a spiral of any desired length, or curve it, or twist it into fantastic shapes. These workmen earn good wages, for, although the price of their labour has fallen greatly in recent years, each can command from 15 to 20 francs a day. In the golden age of glass-blowing, ten to twenty years ago, 20 francs a day was considered poor pay, and skilled men received from 25 to 35 francs, some experts even more, but, as everyone knows, the present days are never worthy of comparison with the days gone by. The glass-blower earns every sou he receives, however, for the labour of manipulating the masses of molten glass is not only exceedingly exhausting, but the dexterity required causes a constant drain on the nervous system, to say nothing of the oppression caused by the high temperature. To endure an atmosphere where the ther-

mometer always ranges from 100 to 125 deg. Fahr. is of itself sufficiently exhausting; to perform labour requiring a high degree of dexterity and great muscular strength in such a temperature is well-nigh killing. It is not remarkable that pneumonia and pleurisy and consumption, with other diseases caused by the sudden change from the glass-house to the open air, make great ravages among the workmen. Improvements in the mechanism applied to the manufacture have resulted in the blowing of the great glass spheres by an air blast, but in most lines the machine has not yet learned the dexterity of human fingers, and so “hand-made” is still true of a considerable share of the glass product. Not all the work, however, demands strength. The great spheres must be cut up. And with the aid of a diamond-pointed cutter and a deft young lady, the transparent globes soon lose their shape and become piles of little saucer-like discs, to be afterwards moulded into various shapes as the needs of the trade demand. It is a wonderful industry. It is a sight to be remembered. From the pots, containing from 20,000 to 40,000 kilogrammes of molten transparency, come bottles, flasks, jars, vases, long transparent serpents, and cables of glass that can be twisted and tied in knots while plastic, and then grow inflexible as hardened steel. There is no end to the possibilities of glass; even fair woman has enclosed her bewitching form in glass, and robes of this material, spun and woven, have displayed the charms of more than one belle at Versailles and the Louvre. Alike in the fine arts and in the scientific industries this century is the age of glass and the genius of the glass-pot.

### THE STRIKE AT THE PENRHYN QUARRIES.

ON September 30 last the North Wales Quarrymen’s Union applied to the Board of Trade with a view to official intervention under clause 2, section C, of the Conciliation (Trades Disputes) Act, 1896. The Board of Trade accordingly entered into communication with Lord Penrhyn. It was announced that his lordship was prepared to have an interview with a deputation representing the quarrymen. On December 5 the quarrymen met and selected three members to form a deputation to wait upon Lord Penrhyn. The desire was expressed that one or more representatives of the Board of Trade should, if possible, be present at the first interview, believing that the adoption of this course would greatly facilitate the opening up of negotia-

tions, and that the deputation should be accompanied by its own interpreter and also by its own shorthand writer, if any notes of the proceedings were to be taken.

Lord Penrhyn was officially informed by Sir Courtenay Boyle that the Board of Trade were prepared to send down such a representative, and a hope was expressed that the suggestions about a reporter and interpreter would not cause any difficulty. In reply Lord Penrhyn said that while he was willing to receive the deputation of his employés he must decline to comply with the suggestion about the official of the Board of Trade, as the acceptance of it would establish a precedent for outside interference with the management of his lordship's private affairs. He agreed to the proposal for a shorthand writer and interpreter, provided they were not among the seventy-one employés who had been suspended. Sir Courtenay Boyle then informed his lordship that the Board of Trade could not admit that the settlement of a prolonged dispute, affecting some thousands of men and their families, can be rightly regarded as a matter of private interest only.

As regards the reporter and interpreter, the Board were informed that persons suitable for the purpose were not to be found among the rank and file of the quarrymen. Lord Penrhyn's reply was that the arrangements named in his last letter for the proposed interview are exactly the same as those under which previous deputations have for many years (and up to the time of the strike) attended at his office, and the request that the deputation should bring anyone from outside as an interpreter and shorthand writer he must, for obvious reasons, decline to assent to.

Finally, Sir Courtenay Boyle wrote:—

"The Board, on the invitation of the men, placed themselves in communication with you because experience of similar difficulties led them to believe that the best prospect of terminating the present difference—a result which they assume that you, as well as the men, desire—would be by a friendly conference between yourself and your workmen at which a free exchange of views might take place on the various points to which importance is attached on each side. Under the conditions on which you insist, they would have to come to you, not only without any of their chosen leaders, but also without their own interpreter or shorthand writer, and without the presence of any impartial outsider which they desire, whilst you would have the advantage of skilled advice. Having regard to these conditions, it does not appear to the Board of Trade that

they could at present usefully take any further steps to promote the desired conference."

On Saturday last the quarrymen met and passed a resolution expressing gratitude to the Board of Trade for the patient care taken to obtain a settlement of a dispute which affected thousands of men and their families, and another resolution by which they decided to stand by one another till right was done. A correspondent of the *Times*, writing from Bangor on December 28, says:—

The Penrhyn quarries, as most persons know, are among the largest, if not actually the largest, slate quarries in the world. They are situate in the immediate vicinity of the town of Bethesda, of which they are the *raison d'être*, and they have been the property of successive owners of the Penrhyn estate. In the year 1874, in the time of the late Lord Penrhyn, the quarrymen succeeded in ousting the then manager at Bethesda, and in obtaining, through a committee, practically the entire control and management of the great quarries. This state of things lasted until 1885, and there need be no hesitation in saying that, under the rule of the committee, the men obtained, so long as affairs were regarded from a shortsighted point of view, great advantages and benefits, the like of which they will never enjoy again. The owner's interests were hardly so much as considered in the management of the quarry, no regard was paid to the future prospects of the quarry, good rock was worked extravagantly, rubbish was not cleared away in due proportion, and the wage-rate was far higher than in other and competing quarries. From the owner's point of view, however, the position became serious and even critical by the year 1885, and the present Lord Penrhyn, then the Hon. G. Douglas Pennant, came in to the assistance of his father, with a free hand and full authority, at a time when it became a question whether the quarry could be kept open at all for many months longer. The newcomer went to work in a resolute frame of mind. He abolished the quarry committee; he resumed on the part of the owner the complete control of the management of the quarry; he reduced the extravagant wages, and, in a word, reorganised the whole enterprise in a business-like spirit. The story of the next ten years was, on the whole, peaceful, and there can be no question that the quarry grew greatly in prosperity.

It was in the autumn of 1895 that signs of impending trouble began to appear, and an "organiser" was appointed to work among the quarrymen. Early in the autumn of this year things began to assume a somewhat dangerous appearance, and it is essential to a true appreciation of the situation that the precise

sequence of events should be given. On August 7 a memorial of grievances, signed by seven persons, was sent to Lord Penrhyn. On August 17 Lord Penrhyn had an interview of four hours with the representatives of the men, who were distinctly informed that they were received not as a committee and that Lord Penrhyn absolutely declined to recognise a committee. At this interview the alleged grievances of the men—which are for the most part of a very technical character—were discussed at length, and a transcript of the shorthand note of the interview was published and supplied to the men within a week. On August 20 Lord Penrhyn printed a reply to the memorial and to the allegations made by the men at the interview, and that reply calls for two observations. It must, I think, be admitted on all hands that Lord Penrhyn succeeded in showing that a large number of the general allegations of the men had been made in the absence of any evidence to support them. On the other hand, there remained, and still remain a substantial number of demands which Lord Penrhyn was not prepared, and to all appearances never will be prepared, to concede, because, in his judgment, they involve the restoration of the quarry committee to the position which it occupied before 1885. On August 26 the men replied by a reiteration of their original complaints, and at this juncture comes a point of some importance. It has been stated repeatedly that Lord Penrhyn's reply to the reiterated complaints was the immediate dismissal of the seventy-one men forming the committee. The plain documentary evidence absolutely disproves this statement. Lord Penrhyn and his advisers spent weeks in investigating and considering the whole matter, and on September 25 Lord Penrhyn issued a statement in fifteen closely-printed folio pages. In this he dealt with the standard wage, which he declined to raise, on the ground that the average wages earned by quarrymen were in excess of that standard; he declined to recognise, for the usual reasons, the theory of a minimum wage; and then he proceeded to analyse some specific allegations of grievance in the case of particular individuals. He dealt also with the question of contracts and a corollary allegation of sweating. He also appended, as an answer to the men's low wage list, a table showing the earnings of the "crews" mentioned in that list for several months, and not for one month only, the object being to show that the standard wage had—"days lost" being deducted—been earned by all. Finally, he reiterated his desire to listen to all serious complaints in the usual way; but he made it

clear, not for the first time, that he would not listen to those complaints coming from a committee.

On the following day the committee resolved, and their resolution was announced publicly, to declare a strike in March next unless their demands were conceded in the meanwhile; and it was not until September 28—that is to say, after the March strike had been announced and after the committee had ordered disobedience in the case of two men who were summoned to the quarry office—that Mr. Young, the manager, suspended *sine die* seventy-one men who formed the committee. On the evening of the same day, at a mass meeting, a resolution in favour of an immediate strike was carried. That is the strike which is now going on, and the above facts prove beyond question that Lord Penrhyn's action, although resolute, was not precipitate. He is reproached, of course, with aiming a blow against combination, the sacred right of workmen; but to the plain man it is manifest that the suspensions did not take place until after the committee had ordered men to disobey commands or until after the committee had announced publicly their intention of causing a strike to begin in March. Lord Penrhyn's attitude on the matter as described by himself is that he does not object to any combination among his men, but that he is determined to remain master of his own quarry.

Meanwhile the Board of Trade had, at the request of the men, been in correspondence with Lord Penrhyn with a view to bringing the Conciliation Act of 1896 into operation, and before dealing with that correspondence it is imperative to call attention to the fact that, unless the statement of the early history of the dispute which has been given is borne in mind, the correspondence may produce a false impression. To one unacquainted with the facts it must appear from the correspondence that the suspension of the seventy-one men was the immediate, almost the direct consequence of the men's appeal to the Board of Trade; whereas, in fact, the suspension of the committee came at the end of weeks of careful inquiry, after a resolution to strike in March, and after the committee had incited men to disobey orders. Now Lord Penrhyn may be right or may be wrong—that is a matter upon which there will be many opinions—but he has certainly not been precipitate. It may be observed that, whereas the correspondence between Lord Penrhyn and the Board was supplied by the Board to the men, Lord Penrhyn had not been supplied with a copy of the correspondence between the Board and the men, and that he is inclined to regard as one-sided the treatment which has been measured out to him.

Mantel & Overmantel complete £4. 15s.

Meanwhile, from the correspondence two points emerge. First, the Conciliation Act being optional and not compulsory, Lord Penrhyn is clearly resolved not to permit it to be applied to him, and no man can deny that he is within his legal rights in refusing to permit representatives of the Board of Trade to be present at the proposed interview. He thinks, in effect, that the presence of Board of Trade officials would tend to weaken the authority of the quarry officials in the future. My own view, which is merely personal, is that he is prudent in assuming this attitude, because this is one of those matters which are not in the least likely to be settled easily, and in which conciliation, useful when well timed, is premature, and for that reason harmful. In the matter of the shorthand writer, which is really not very important, Lord Penrhyn has not, perhaps, been wise. A competent shorthand writer is not likely to be found among the quarrymen, and a really competent interpreter is very rarely to be found anywhere in Wales. Lord Penrhyn inserted his stipulation mainly because he did not desire the presence of any outsiders in the dispute; but he might have said with equal reason that the accuracy of his own shorthand writer's note of the four-hour interview has never been questioned.

The main interest of the situation is to be found in the fact that the man who has managed a great enterprise for many years, a man who is famed for generosity and for resolute disposition, asserts in the face of an optional Act of Parliament his right to manage his own business in his own way and his right to oppose, not the principle of combination, which is one thing, but the acts of a combination, which are a very different thing, by all legal means. After all is said in favour of trade unionism, it is a strong thing to assert that a man is bound to keep in his employment the men who announce in September that they mean to cause a strike in March. Indeed, the suggestion recalls the fable of the man who nursed a viper in his bosom. If I remember rightly he paid dearly for his tenderness of heart.

#### LONDON COUNTY COUNCIL WORKS DEPARTMENT.

ON December 23 another sitting was held of the special committee appointed by the London County Council to inquire into the management and financial position of the Works

Department, when Mr. T. Blashill, superintending architect to the Council, continued his evidence.

In reply to Dr. Longstaff, Mr. Blashill said that the evidence he had already given related entirely to architectural work, which was very much more complicated than engineering work. In the Blackwall Tunnel, a work costing upwards of 800,000*l.*, there were only 935 items, whilst in the construction of a weights and measures testing station there were as many as 2,175. He could not conceive how ten men could have been employed on the lamp at the Blackheath fire-station, which he had mentioned at the last sitting. When the wages of men were charged who could not possibly have been employed it was open to the construction that it might have been a transfer from some other job or an accident. He knew of other cases where the cost charged was out of all proportion to the work done. On the repair of a lamp at the Chelsea fire-station in 1894 nine men were charged. This estimate was 1*l.* and the cost came out at 2*l.* 13*s.* 3*d.*

Dr. Longstaff: Do you consider that the Works Department has been successful in respect to small jobs?—I think seldom so. Has the quality of the work been satisfactory?—Generally satisfactory.

Better than you generally get?—I think quite good enough.

Has the cost been satisfactory?—No; but I may say that the cases I have mentioned may be open to the construction that they represent other transactions, but they are only the residuum after we have cleared away a large quantity of accounts with respect to which we agree, and a similar quantity with respect to which we might arrive at a compromise, and then there are the remainder that await investigation.

Do you think the system of doing these jobbing works by the works committee or by local contractors the most expeditious?—No doubt that of doing them by local contractors. We have had complaint of considerable delay in work done by the Works Department. I do not believe that the Works Department has ever wilfully done bad work. I have noticed bad work done by the department, but that might be owing to carelessness of the men. That shows that supervision is requisite in every case. I have heard only a little, and know less, about insubordination on the part of the workmen in the department. I have distinctly heard of workmen refusing to obey their foremen. From the information I have received from one source and another what is complained of is the avoidance of work by the men when actually on a job. The reason alleged why men have refused to obey the foreman is

that they looked to the members of the works committee as their masters, and not to the foremen.

By Mr. Beachcroft: In the case of work done by the department for the housing committee the excess had been 9,980%, but that was largely caused by the cost of the earlier works. The reason of the excess had been attributed by the manager of the department to too stringent supervision by the architect, the use of materials of too high a standard, the excessive labour bill, and that there was interference on the part of the members of the committee. It was not a fact that materials had been demanded of too high a quality, or that he had been too stringent in his supervision. It was not within his knowledge that members of the committee attended at the works. He had heard so, and that it was particularly the case with regard to the members interested in labour. He had also heard it stated that members of the committee had relations employed on the Council's works. Considerable delay had been caused in the work by the department searching for the cheapest materials. It was impracticable and unnecessary for the department to tender with contractors. If the committee were retained, he was in favour of some work being in the future done by the committee and some by contractors. Since he last gave evidence he had heard that that was the system adopted both in the Admiralty and the Ordnance Department, who did a certain amount of work themselves and put the other out to contract. He thought the list of extras was much the same whether the work was done by contractors or the department. In justice to the department he must say that they were most pertinacious in agreeing to his notices as to extras. There were generally firms in the system of advertised tendering who did not know how to make an estimate; some would be exceedingly high and some very low. Some tendered simply to get back their deposit money and to get their names before the Council. If they struck out two or three tenders at the top and two or three at the bottom they generally got a body of tenders not very far apart. He did not make his specification with a view to the work being done specially by the Works Department or by contractors. He thought that was a great disadvantage. He had said that he would like to see the works committee abolished and the manager made supreme, but in saying that he did not mean that he should be independent of official control by the spending committees. He was unable to give any opinion as to whether 20,000% a year for establishment charges was too high. He did not know that the labour bill was now about 7,000% a week.

Mr. Beachcroft: Do you think the ratepayers are ever likely to get advantage from the municipality undertaking architectural work as distinct from engineering work?—Not a peculiar advantage. I am of the same opinion now as I have previously expressed, that the financial result is not one that would be of any importance. With regard to works generally, if it were left to me, and there were no other objections, I should think it better to deal with one set of persons than with twenty sets of people, and if the Works Department can carry out the work well and economically and with no other disadvantage, I would rather have to deal with them than with outsiders.

By Mr. Davies: He had heard of private employers making arrangements with their men as to wages in return for constant employment. He did not think the abolition of the Works Department would have any effect on the rate of wages in the building trade in London. He could not think fair progress had been made by the department; it should have made more profit. He knew that something like 100,000% had been expended by the Council in the establishment of the Works Department. He certainly would not advocate doing away with it altogether as it now stood, but in advocating the abolition of the works committee he was not considering whether the members of that committee did too much or too little, but that they might do particular things which were objectionable. He did not remember having to complain of the scaffolding and plant of contractors as being dangerous to life and limb. He did not think that painting work was the easiest of all work to scamp, but it was possible to do it too thoroughly. He had heard complaints of contractors not properly preparing the ironwork for painting, and he had also heard complaints as to certain painting jobs done by the Works Department.

By Mr. Torrance: It was true that the works committee had suggested that small works should no longer be executed by them, but by local men. He had no real evidence of his own knowledge of any member of the works committee interfering with the internal management of a job. He thought if the committee had to look over such a large amount of work they might feel the responsibility of their position and visit the works in progress, but they should do so with the knowledge that their proceedings should be so carefully conducted that it would not lead to the mischief which it had been asserted had been caused. He had had difficulties with contractors, but sooner or later, in every case, the work had been brought up to

the required standard. Some work was better than others, but it was all within the required standard. The quality of the work done by the Works Department had been as a rule good. He felt sure that, properly managed, the Council could do a large portion of its work better than the contractors. With regard to the rest, he might admit that they could make a trifling profit, but nothing of importance.

Mr. Torrance: In the interest of the ratepayers is it not, in your opinion, an imperative necessity that the Council should carry out the bulk of its own work?—I am not sure what interest you mean. I can only consider the financial interest.

I mean that.—I should modify it in this sense, that the Council might carry out enough of its work in order to insure contractors being fairly treated, and, if necessary, I should increase it. I think the whole thing is in an experimental state. The London County Council is the experimenter.

In answer to further questions by Mr. Torrance, the witness said he thought the Works Department had surmounted the principal difficulties which faced it at its initiation. It had learned wisdom by experience. He believed that ultimately the Council would attract superior workmen to its service. He had not been more severe in his criticism of work done by the Works Department than of that done by contractors.

By Mr. Fletcher: He was certainly against the department tendering against contractors. If it was done the result would certainly be that the best contractors would cease to tender for the Council's work. He should object to any such experiment being made, because he felt certain that it would be a failure. He thought the standing orders might give discretion to the spending committees to send their work either to the Works Department or to contractors. He had heard of considerable complaint that workmen in London did not get a fair share of the Council's work. Those complaints would continue as long as the Council did all its work exclusively from one centre in Belvedere Road.

By Dr. Collins: He put down the profit of contractors in their tenders at about 8 per cent. He had stated to Sir John Lubbock that prior to the establishment of the Works Department, the contractors had carried out work at 6 per cent. below his estimate. That information he had gained from a sheet published some years ago.

The witness was still under examination when the committee adjourned until Wednesday, January 13.

Amongst the documents put in during the sitting was a report by Mr. C. J. Stewart, the clerk of the Council, on the establishment of the Works Department and the work generally of the works committee. In the course of this report Mr. Stewart stated that in 1895 the works committee suggested to the various committees that jobbing works to be carried out a distance of more than three miles from the central works and of an estimated value of less than 3*l*., should not be entrusted to the works committee unless there was a difficulty in getting them executed otherwise. The bridges committee and public control committee stated that they would adopt the suggestion, but increased the value to 5*l*.. The fire brigade committee had on several occasions brought before the Council the question of the cost of jobbing works executed for that committee by the Works Department, and recently the Council, on the recommendation of the fire brigade committee, resolved that the jobbing work required at fire brigade stations should be executed at the option of the fire brigade committee by contractors or by the Works Department. The Works Department did not compete with contractors in tendering. The procedure was for the particular committee which desired the execution of works to lay before the Council the officer's estimate and to recommend the Council in what way the work should be carried out, *i.e.* either by a contractor, by the Works Department, or by labour employed directly by the originating committee. If the recommendation was to the effect that the Works Department should do the work, the recommendation was in the following terms:—"That the work be executed without the intervention of a contractor, and that the plans, specification and estimate be referred to the works committee for that purpose." The works committee then reported on the estimate submitted to the Council by the executive committee, and if the works committee was satisfied as to the sufficiency of the estimate, it proceeded at once with the work. In the event of the committee not deeming the estimate sufficient, it reported to that effect to the Council, and the estimate was referred back by the Council to the originating committee. The practice had then been for tenders to be invited and the works carried out by contract. There had, however, been two cases in which works had been refused by the works committee, and tenders having been invited and found to be in excess of the estimate the works had eventually been referred to the works committee on a revised estimate. The average time

occupied by the ordinary meetings of the works committee and its sub-committees was six hours a week, and the inspection by the committee of the works in progress, which was held half-quarterly, averaged about six hours. The sub-committees were (1) finance, (2) plant and materials, (3) horse, vehicle and fodder, (4) wages and staff. Directly the manager had authority to commence any work he, in accordance with the instructions of the committee, selected six or more firms from whom he invited tenders for materials, and if the value of the materials required was of sufficient amount, invited tenders by advertisement and submitted the quotations to the sub-committee, which had power to authorise the goods being ordered subject to a report of the steps taken to the committee. The valuation of plant and machinery at the central works and various works in progress was made at March 31 by the engineer and valuer, and the list of stores and materials was checked by the comptroller. Foremen and timekeepers employed at the various works were appointed and dismissed by the manager of the department, and the gangers and workmen were engaged and dismissed by the foreman of each work. The officers at the central works were members of a superannuation fund, and the clerical staff were placed on the fund after being twelve months in the Council's employ. At the conclusion of his report Mr. Stewart submitted a return of works carried out by the Works Department and reported to the Council since its establishment. From this return it appeared that for works supervised and carried out under estimates furnished by the engineer, the original estimate was 156,171*l.*, the final estimate 144,695*l.*, and the actual cost 130,604*l.* In this amount is included work for the main drainage committee, for which the original estimate was 64,987*l.*, the final estimate 58,142*l.*, and the actual cost 44,849*l.* On the other hand, work for the bridges committee, which was finally estimated at 50,174*l.*, actually cost 50,773*l.* Work supervised by the architect for the asylums committee was estimated at 14,369*l.*, and cost 14,774*l.* The work supervised and carried out under estimates furnished by the architect was 224,416*l.*, and the actual cost 232,211*l.* Included in this amount is work done by the housing committee, the estimate for which was 121,801*l.*, and the actual cost 131,781*l.* The summary of all the works executed by the department and reported to the Council shows that the final estimate amounted to 383,538*l.*, the actual cost being 377,643*l.* From March 1895, when the schedule of prices came into operation, the schedule value for jobbing works carried out by the department has been 29,372*l.*, whilst the actual cost has been 27,410*l.*

### A NEW WAY TO STRENGTHEN FOUNDATION PIERS.

IN a recently constructed large office building in New York, says the *Engineering Record*, some of the exterior main columns of the steel-cage framework have isolated foundations which consist of 8 by 8-feet hard red brick piers, which are supported on the natural soil composed of fine sharp sand, dry and compact. In the centre of the capstone is an iron pedestal about 4 feet square which receives the column, carrying a computed maximum load of 420 tons. When the building was approaching completion, after the columns had been enclosed in brickwork, it was observed that in four of the piers cracks had developed that extended through the capstone and into the brickwork, reaching down to the stone binders. These cracks had a maximum opening of about one-quarter inch, and generally extended entirely across the capstone parallel to the sides. Alarm was felt for the safety of the building, and an investigation was conducted by the Department of Buildings to determine whether repairs could be efficiently carried out. The piers were carefully examined by different engineers, architects and inspectors. Various theories were presented to explain the cause of failure and different remedies were suggested, involving the removal or considerable alteration of the piers.

Mr. John F. O'Rourke, C.E., New York, was retained by the contractor for the building, and reported substantially that the trouble was primarily due to the capstone, which had to distribute the heavy column load concentrated upon 18 square feet of its upper surface and transmit it evenly to the whole 64 square feet of upper surface of the brick masonry. The elasticity of the brickwork, he assumed, made the functions of the capstone those of a beam, and he computed that the strains of flexure were high for the material of which it was composed, particularly if any defects existed in the capstone or its bed, though very moderate when straining it by direct compression only. He therefore concluded that if he could take up the tensile strains developed by flexure and properly fill all the openings in the masonry, the piers would be efficient and have ample strength for their loads. To this end he designed a reinforcement that could be easily applied to each pier, and which consisted of two pairs of adjuv able through tie rods in opposite directions at the top of the brickwork, arranged to exert a heavy pressure on its four outside faces in opposition to the assumed tension in the lower part of the capstone, together with a method of grouting under pressure.

Full Illustrated Catalogues Post Free on Application. Established 1880.

The loads per square foot on the different foundation surfaces were computed as follows:—On soil under concrete, 1·9 tons; on top of concrete footing, 2·7 tons; on top of brick pier, 6·75 tons; on top of capstone, 23 tons.

From the above data and the dimensions Mr. O'Rourke computes that—

Before rupture the maximum strains were developed when the bending moment at either the longitudinal or transverse section through middle of shoe is equal to one-quarter the total weight, multiplied by the difference of the distance from middle of shoe to centre of pressure of half-shoe and of half part of cap considered.

Bending moment in middle section running north and south.

$$M = (24 - 11·75) \times 21,000 = 2,572,500 \text{ in lbs.}$$

$$\text{Moment of inertia of section of cap} = \frac{BD^3}{12}$$

$$I = \frac{96 \times 16 \times 16 \times 16}{12} = 32,768.$$

$$\text{Extreme fibre strain} = \frac{M \times \frac{1}{2}D}{I}$$

$$\frac{2,572,500 \times 8}{32,768} = 630 \text{ lbs. per square inch} =$$

about 500 lbs. per square inch at this time.

The whole tension in caps at the middle in the direction considered is equal to two-thirds of one-half the extreme fibre tension multiplied by one-fourth the depth multiplied by the width =

$$\frac{2 \times S \times D \times B}{3 \times 4} = \frac{630 \times 16 \times 96 \times 2}{4 \times 3} = 163,000 \text{ lbs.}$$

In the middle section of caps running east and west the shoe being placed nearer the south side of cap the bending moment is somewhat less and need not be calculated. The effect of the eccentric loading being to cause a smaller transverse strain in the cap and a greater compression in the brickwork at the side nearer the shoe, the rods proportioned to suit the first case will be ample for the second.

Two-inch rods were used, and their efficiency was determined as follows:—

$$3·14 \text{ square inches} \times 15,000 \text{ lbs.} = 47,100 \text{ lbs.}$$

In order to equalise the strains in the capstones each rod is

placed half-way between the outside of the piers and the middle of the shoes. With the rods screwed up a tension of 15,000 lbs. per square inch, the strains in each pair would be 94,200 lbs. This force reacts against the capstone and brickwork, reducing the tension in capstone that amount. Two-inch rods are therefore amply strong to supply sufficient tensile strength to the cap to enable it to distribute pressure of base of casting over the whole top of brickwork. The strains in the cast washers were determined in the usual manner, and the dimensions are sufficient for strength in the washer and for distributing the reaction on brickwork and granite, so that 15 tons per square foot pressure is not exceeded. If the capstones had no tensile strength because of cracks or flaws the rods would still supply all the strength necessary to enable the caps to distribute their load uniformly over the whole area of the brickwork without reaching the elastic limit of the steel, which practically would never be reached, as the brickwork would take up much of the tension.

A prospector's ordinary diamond drill driven by a small steam-engine was set up and two 2½-inch holes were drilled through the top of each of the four disabled piers on each side, about ten hours being required to drill each hole. The water, which is abundantly supplied to the bit by its special attached pump, escaped through both holes, and was collected in semi-cylindrical tin vessels on the sides of the pier. Perfect continuous cores were taken out of the holes, and showed solid sound brick well cemented together. No difficulty whatever was observed in operating the drill through the interior brickwork, even where the pressure was estimated to be more than 40,000 lbs. per square foot. After the holes were completed a small electric lamp, operated by a storage battery, was attached to a light wooden rod bearing a 45-degree reflector, and inserted into the whole. The rays of light from the walls of the hole were reflected parallel to its axis by the mirror, so that any given point could be made visible to an observer looking into the hole. This novel method of examining the interior of masonry piers was devised for the occasion by Mr. O'Rourke, assisted by Mr. Charles L. Eidlitz, electrical engineer.

The whole interior surface of each hole was thus carefully explored by Superintendent of Buildings Constable and the other experts, and the masonry was found to be in good and satisfactory condition.

An upset screw-ended 2-inch steel bolt, 9 feet 4 inches long,

was then inserted in each hole, four for each pier, and the ends of the hole enlarged just above it at each end to receive a horizontal 2-inch iron pipe, which was carefully caulked in with oakum. A few inches from the face of the pier the pipe was bent 90 deg. and extended vertically upwards about 9 feet and terminated in a galvanised-iron funnel. Portland cement and water were then mixed about 1 to 1, forming a thin grout whose volume was about 80 per cent. of the sum of its constituents. This grout was poured into the funnels and filled the spaces around the bolts and the adjacent interstices of the masonry, penetrating it indeed so thoroughly that it exuded in many places through the face joints of the courses as well as through original cracks. Wherever grout escaped the opening was caulked with oakum, and the pouring was continued until it ceased to subside in the funnels.

After the grout had set sufficiently the pipes were removed, and it was found that the surplus water had been taken up by the bricks, leaving a solid mortar of neat cement forced into the openings in the piers. Heavy cast-iron webbed bearing washers, 5 inches deep and 18 inches square on their bases, were put on the ends of the rods so as to seat on the dressed surfaces that were prepared to receive them both on the brick and the stone faces. Rich cement mortar was plastered on behind these washers, and the nuts on both ends of the rods were simultaneously screwed up on them as tightly as possible by two men on a 6-feet wrench at each end, developing an initial tension in the rod roughly estimated at about 48,000 lbs. The whole time required to make the repairs was about thirty days. It is about one year since the completion of this work, and it is considered to have given entire satisfaction. The piers are reported to appear perfectly sound and firm, and show no evidence of settling or weakness.

#### GRAVEL-DIGGING ON COMMONS.

A DECISION of no little importance to London commons was given, writes a correspondent of the *Times*, in the Queen's Bench Division. During the past summer a controversy, to the importance of which the *Times* drew attention at the time, arose between the District Council of Bromley and the Conservators of Hayes Common, respecting the right to take gravel from the common for the repair of the roads. It is well known that the highway authorities have, speaking generally, the power of resorting to open waste lands for road material,

and very serious is the injury done to many commons by the exercise of this power. Within the last month a noted Druidic monument standing on a Devonshire common was invaded by the highway contractor and suffered irreparable injury at his hands. It may be doubted whether blocks of masonry obviously placed in a position of set purpose and in fact constituting, in a large sense of the word, a building, come under the category of "stones," for which a road authority may "search," but the destruction of soft, springy turf, such as that on the Surrey Downs, in order to extract the underlying flints, is almost certainly lawful and is quite certainly largely practised. In 1876, when the question of preserving and regulating commons was under the consideration of Parliament, the injury which might be inflicted upon a place of recreation by the highway authorities was recognised, and a provision was inserted in the Commons Act for the protection of such places. Wherever a common had been placed under regulation in the interests of the public the highway authority was forbidden by the Act to search for road material, except with the consent of the body managing the common, and where this consent was refused the road authority was empowered to appeal to the justices in petty sessions for an order sanctioning recourse to the common under such conditions as the justices might see fit to impose. This provision has practically put a stop to gravel-digging on London commons, for the London County Council and the other bodies having charge of such commons have naturally refused their consent, and we believe in two cases only has the highway authority challenged their decision. Soon after the passing of the Act the Wandsworth Board of Works appealed to the justices for power to dig on Wimbledon Common, and appealed in vain. And now the District Council of Bromley have applied to the justices in relation to Hayes Common.

But the view which the Bromley justices took of the law raised a more important question than that of the possible disfigurement of the particular common in question. The justices came to the conclusion that they had no discretion to make or refuse an order, but were bound to sanction the taking of gravel from the common, subject only to any conditions they might think fit to impose. The road authority was entitled, they held, to an order as a matter of course; all that the justices could do was to specify the places in which digging might be carried on and the manner of such digging. Happily, two eminent judges of the High Court have held, upon a case stated by the justices for their opinion, that there is no foundation

whatever for such a view. The Act of 1876, it is now judicially declared, gave the conservators of a common a veto upon gravel-digging, subject to an appeal to justices, who have an absolute discretion—and a discretion which they are bound to use—to confirm or annul such veto, and, in the latter case, to impose suitable conditions upon the exercise of the power which they allow. The application of the Bromley District Council is therefore relegated to the local justices, who will have now to consider the arguments of expediency for and against gravel-digging on Hayes Common.

It would not be seemly that we should say a word upon this question, which will no doubt receive full consideration at the hands of the justices. But the public of London and of the country generally is to be congratulated warmly on the decision of the High Court upon the question of law which was raised. For, had the application to the justices been held to be a mere matter of form, it is to be feared that many commons would have fared badly; indeed, further legislation would have been necessary for their protection. For, practically the power of gravel-digging would have remained absolutely in the hands of the road authority, and it would have been entirely optional with them to regard the wishes of the body managing the common. Wherever any saving to the highway rate could be shown, the district council would probably have felt impelled to exercise a power which they enjoyed subject only to the observance of certain forms. The provision of the Act of 1876 would have been a dead letter, and London commons, which have been free from disfigurement at the hands of the road-contractor for the last twenty years, would again have fallen under his sway. This danger the recent unhesitating declaration of the law by Mr. Justice Wills and Mr. Justice Wright has averted. Commons which have not been placed under regulation, and thus in a manner set apart for recreation, are indeed still at the mercy of the highway authority. But this authority is now or will be shortly everywhere either the county council or district council. Now district councils are endowed by the Local Government Act of 1876 with many powers of protecting commons, which are thus confided to their care by the Legislature. Moreover, they are bodies which have many functions besides the maintenance of roads, and may thus be expected to take a broad and harmonious view of their duties. It is to be hoped, therefore, that they will not in the future leave to their contractor too large a discretion to break up common lands, and will see that he does not, in the simplicity of his soul, destroy Druidic monuments before anyone knows what he is doing.

### PROPOSED NEW SEWERAGE SCHEME FOR ABERDEEN.

THE sewerage committee of the Aberdeen Town Council have had under consideration a report by Mr. Dyack, burgh surveyor, on the best means of preventing flooding in various parts of the city. He stated that the existing main sewers, excellently as they have done their work during the past thirty years, were never designed to carry the volume of sewage and storm water that the rapid growth of the city now sent into them. The population requiring to be provided for at the present time was 136,000, compared with 63,500 in 1866. What was perhaps of greater importance than the increased population was the extended area of the district to be sewered. This was 6,694 acres at the present time, against 1,280 acres in 1866, or more than five times as much. It was necessary, therefore, to adopt some radical method of dealing with the existing state of matters. The Surveyor estimated the total cost of the various proposed new works at 160,000/. He impressed upon the committee the necessity of at once proceeding with works estimated at 75,700/., or the construction of four portions of the scheme at an estimated cost of 34,000/. The special point in the scheme considered by the committee was that providing for the prevention of flooding at Palmerston Road, and it was decided to recommend the Council to proceed with the enlargement of the low-level sewer between the premises in question and the outfall at Victoria Bridge. The expenditure will be about 6,000/.

### THE HACKNEY BATHS.

AT Hackney Town Hall on December 22, Mr. F. H. Tulloch M.I.C.E., on behalf of the Local Government Board, held a public inquiry with reference to an application of the Hackney Vestry to borrow an additional 18,000/. for the completion of the public baths of the parish. Mr. George Grocott, the vestry clerk, explained that it was originally thought that the baths could be completed for less than 50,000/., but when the building was partially completed the contractor failed, and they had to enter into a new contract. They now required 18,000/. more to pay for the work that had been done. The Inspector asked for details of the increased expenditure. Mr. Grocott said that the land cost 7,000/. The estimate for the building was 36,000/.

but through the breaking of the contract it had cost 40,000/. The cost of the machinery had been estimated at 7,000/. but the expenditure had been 10,500/. Besides these additional expenses they had been involved in litigation, which had cost them several thousand pounds. The Inspector asked why the estimate on the building had been so much exceeded. Mr. Grocott replied that among other things the committee had decided to lay glazed tiles at the bottom of the swimming bath—a great and lasting improvement from both a popular and a sanitary point of view. Messrs. Harnor & Pinches, the architects, were both closely questioned as to details. Mr. Mitchell (an ex-vestryman) attended as a ratepayer to protest against the heavy cost the parish was put to in the building of these baths. The general body of the ratepayers were, he said, disgusted at the large amount which had been spent on the buildings, which would cost at least 80,000/. before they could be opened. Mr. Grocott said that the baths would probably be opened within a month, and the cost would in no case exceed 66,000/. At the conclusion of the inquiry the inspector visited the baths and expressed satisfaction with the arrangements.

### THE INSTITUTION OF CIVIL ENGINEERS.

At the ordinary meeting on Tuesday, December 22, Mr. John Wolfe Barry, C.B., F.R.S., the president, in the chair, the paper read was on "Steel Skeleton Construction in Chicago," by Mr. E. C. Shankland, M.Inst.C.E.

The congested area of the main commercial district of Chicago, confined as it was by the lake, river and railways, had brought about the erection of high buildings. The compressible nature of the soil, however, had made it necessary to build thin walls, carried on a steel frame, with isolated footings, spread so as not to exceed the safe pressure on the clay, namely, about 3,500 lbs. per square foot.

After a brief historical account of the earliest high buildings, a description was given of the mode of designing the steel frame, the disposition of the columns and the framing plans of the roof, attic and each floor being respectively dealt with. In a typical case, the Fisher Building, eighteen storeys high, the live load, made up of the weight of the tenants, the furniture and the partitions, which were constantly being changed, was taken at between 60 lbs. and 75 lbs. per square foot for the upper floors and from 75 lbs. to 100 lbs. per square foot for the

first and second floors, which were generally used for shops and banks. The weight of the tenants and furniture of a typical office was found by experiment to be only 6 lbs. or 7 lbs. per square foot. The average weight of the partitions was 25 lbs. per square foot. Having ascertained the live and dead floor-weights, the weights of the outside walls, the lift-loads, the weights of the lifts and house tanks, and of the water-closet floors, window-panes, glass, mullions, &c., a column sheet was drawn up showing the weight supported by each column at each floor. The live load, except that for the partitions, was then deduced, and the remainder was used in designing the foundations. The unit stresses commonly employed were 16,000 lbs. per square inch per fibre strain in steel H-beams, 15,000 lbs. per square inch for plate girders and 15,000 lbs. per square inch for short columns in compression. The roof was made up of beams and girders supporting tee-bars, spaced at 18-inch centres, between which book-tiles were built. Over the book-tile was spread a layer of cement, and on this a six-ply tar and gravel roof was laid, and the beams supporting the tees were fireproofed. The types of columns in general use were mentioned and their relative merits discussed. The steel smoke-stack had supplanted the brick chimney, special arrangements providing for expansion and contraction of the steel where the stack passed through the roof. The author's practice was to construct the frame to withstand a horizontal wind-pressure of 30 lbs. per square foot over the whole side of the building; the resulting stresses were supposed to be taken up by all the columns in each row. If the maximum stress in any column from live, dead and wind stresses exceeded 25,000 lbs. per square inch, the column was enlarged to bring the stress below this limit. The various kinds of wind bracing employed, including rods, portals, knee-braces and plate-girders between outside columns were illustrated, and the effectiveness of each discussed.

Different portions and connections of the steel frame, as well as the cover column connections, spandrel sections, cornice and roof construction, bay windows and balcony construction, &c., were illustrated and described. The most recent floor arches and column fireproofing were also discussed and drawings of different methods given. It had been stated that there was no such thing as fireproof construction if the phrase were taken in a strictly literal sense, no known substance being able to resist a change of state when subjected to intense heat; but the Chicago high buildings were absolutely fireproof in the sense that they would safely resist any fire which could occur.

## THE "COUNTY" WATCH

The "County" Watch. Direct from the Maker.

Send £10 10s. to H. WHITE by cheque, note or draft, and you will receive by return insured post, safely and securely packed, the "County" watch, which has been manufactured for the use of wearers who desire to possess a thoroughly reliable 18-CARAT GOLD ENGLISH LEVER without paying the high price usually charged for one by the ordinary first-class jeweller. After expending a large sum upon the most improved machinery, H. White has succeeded in producing a really high-class watch at an extraordinarily low price. Movement, case and appearance are alike perfect, rendering the production an ideal watch, likely to afford the utmost satisfaction to the most fastidious wearer. It combines great strength joined to extreme neatness and compactness, so that it will withstand the heaviest wear, yet prove equally admirably adapted for the wear of those engaged in the lightest occupations. It is truly many pounds lower in price than it could be purchased at from any other firm in the United Kingdom. The 3-plate ENGLISH LEVER movement is of fine quality, jewelled in six holes in rubies, fitted with a fine Chronometer Balance and superior Breguet Hair Spring. Heavy 18-CARAT GOLD Half-Marked Case, flat crystal glass, sunk dial and steel hands help to give the watch a matchless and perfect appearance. The fine Chronometer Balance renders the watch particularly suitable for wear abroad, as it would keep equally as good time worn at Capetown, Johannesburg, Calcutta, or Sydney as in London. Truly worth £15. The case is left plain, upon which elegant monogram or complimentary inscription may be engraved. Monogram 5s. extra. Engine-turned cases if preferred. Supplied also in sterling silver cases, engine-turned or polished plain, at 24, worth £6 6s.

A LADY'S ENGLISH LEVER watch, with a similar movement, Chronometer Balance and Breguet Spring, in 18-CARAT GOLD CASES, with sunk enamel dial, steel hands, engine-turned or plain for monogram, is supplied at £7 15s. Usual retail price £10 10s. A most charming and desirable watch.

### CONTRACT OF SALE.

1. Every watch guaranteed for seven years. 2. Money returned in full within ten days of purchase should the watches fail to please (impossible). Sent for inspection upon receipt of banker's reference.

Foreign orders receive careful attention from one of the members of the firm, and are promptly executed and forwarded per insured post to any part of the world at H. White's own risk. Foreign insured postage, 2s. 6d. (British Possessions) others, 5s.

A valuable Guide-Book containing much useful information concerning watches and jewellery will be sent post-free to every applicant mentioning "The Architect." Write for one to-day; it may save pounds.

Money Orders payable to H. White, G.P.O., Manchester.

Bankers—Bank of England, King Street, and Manchester, Liverpool and District, Spring Gardens, Manchester.

## H. WHITE, WATCH MANUFACTURER,

LIFTING MACHINERY OF ALL KINDS.

## J. STANNAH,

20 Southwark Bridge Road, London, S.E.

or around them. This had been shown by severe tests to which certain buildings had been exposed, accounts of which were given.

For preserving the steel frame from rust, the best practice was to thoroughly scrape off the scale and apply a coat of oil at the mill, and a coat of red lead, graphite, or asphaltum after erection. This sufficed for the beams, but all outside columns were filled with Portland cement concrete. The steel beams used in the foundations were always embedded in Portland cement concrete, without being either oiled or painted, as the concrete adhered better to the unpainted metal. In the case of internal columns, when the fireproofing was well fixed and covered on the outside with plaster, the column was surrounded by a nearly air-tight space and the danger from corrosion was small.

Spread footings formed the typical Chicago foundation. Foundations had in some cases been sunk into the hard pan, so as to give greater basement height. Experience had, however, shown that it was safer never to descend below the top of the hard pan. If the borings showed any sand pockets or soft spots, the contractor was required by the specification to excavate them and fill the cavity with concrete. A typical boring was shown, and the results of two tests, to determine the bearing capacity of the clay, were tabulated. The design of a spread footing, on the assumption of a given load per square foot to be used on the clay, was described in detail, and, as an example, a layer of beams in a large footing under the Masonic Temple was computed to show how the number and size of the beams, and their length, were determined. The reason for not using the live load in designing the footings was stated, and a prominent building was mentioned to show the bad effect of using the live load in calculating the foundations. Cantilever construction used in foundation work was described and illustrated. Pile foundations were only used under a few office buildings, and tubes filled with concrete were referred to as unsatisfactory.

The author considered the settlement was caused by the water being squeezed out of the clay, and that it gradually diminished and finally stopped. This was illustrated by an occurrence during the construction of the Masonic Temple, and was further shown by the settlement curves of the same building, extending over a period of four and a half years. The amount of settlement of the high buildings amounted to nearly 1 foot, and the footings were raised when construction was begun in anticipation of it.

The weight of the steel frame in an office building from sixteen to twenty storeys in height was very uniform, ranging between 1½ lbs. and 2 lbs. per cubic foot of the building. The cost was between 4·9 cents. and 6 cents. per cubic foot, being from one-seventh to one-ninth the cost of the building. The length of time required to completely finish a high building was between seven months and one year.

### PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

#### APPLICATIONS FOR PATENTS.

- 28582. George Duffield, for "Improvements in or connected with water-closets."
- 28611. Leo Cohn, for "Improved device for indicating the stoppage of water-closets."
- 28615. Henri Schroer, for "Improvements in tiles suitable for roofing."
- 28664. Donald Fletcher, for "Improvements in mechanism for lifting, lowering and locking window-sashes and other articles."
- 28671. Charles Stowe, for "Improvements in traps for waste-pipes and the like."
- 28749. James Minto, for "An improved automatic flushing cistern."
- 28824. Thomas Martlew, for "Improvements in or relating to chimney ventilating and like cowlings."
- 28962. John Dibble and Samuel Henry Dibble, for "Improvements in and relating to combining a water-closet and a sink."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CO., Patent Agents, 37 Chancery Lane, London, W.C.

# THE NEW EXPANDED METAL

**Mesher from ½th in. to 6 in. wide. Strands from 24 B.W.G. to ⅜th in. thickness of steel.**

**FOR BUILDING CONSTRUCTION**, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

**FOR SOLID PLASTER PARTITIONS**, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

**FOR FIREPROOF LATHING**, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

**FOR CONCRETE FLOORS WITH EXPANDED METAL**.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

**FOR EXTERIOR WALLS OF BUILDINGS**.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

**FOR FENCING, TREE GUARDS, WINDOW GUARDS**, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

**ORNAMENTAL. STRONG. CHEAP.**

**OTHER USES FOR EXPANDED METAL**.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away.

Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

**BRASS, ALUMINIUM**, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

**CATALOGUES AND PRICE LISTS** can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

**THE EXPANDED METAL COMPANY, LTD.,**

**39 UPPER THAMES STREET, LONDON, E.C.**

Telegraphic Address, "Distend, London."

Works—WEST HARTLEPOOL.

Telephone No. 1829.

## NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

*For Advertisement Scale, see page xiii.*

## CONTRACTS OPEN.

ALNWICK.—Jan. 16.—For erection of new choir vestry and other works at St. Paul's Church. Messrs. Forster & Paynter, Fenkle Street, Alnwick.

ALNWICK.—Jan. 18.—For erection of four-roomed cottage at Christon Bank. Mr. M. Temple Wilson, architect, 69 Narrowgate, Alnwick.

BIRKENHEAD.—Jan. 18.—For erection of an additional ward pavilion in connection with the infectious diseases hospital at Flaybrick Hill. Mr. Charles Brownridge, borough engineer, Town Hall, Birkenhead.

BOURNEMOUTH.—Jan. 15.—For erection of a house at Canford Cliffs. Messrs. Pinder & Fogerty, architects, 2 St. Peter's Terrace, Bournemouth.

BRADFORD.—Jan. 14.—For erection of stables and coach-house in Morley Street. Messrs. Emsall & Clarkson, architects, 7 Exchange, Bradford.

BRADLEY.—Jan. 13.—For erection of Primitive Methodist chapel and school. Mr. Jas. Hartley, architect, Exchange Buildings, Skipton.

BROADHAMPSTON.—Jan. 16.—For restoration of the roofs, &c., of Broadhampston Church. Mr. Edmund Sedding, architect, 12 Athenæum Street, Plymouth.

BROMLEY.—Jan. 25.—For erection of refuse-destructor buildings and cart-sheds, stores and quay wall. The surveyor, 117 High Street, Poplar.

BURNHAM-ON-CROUCH.—Jan. 18.—For erection of new schools. Mr. Fred Chancellor, architect, Chelmsford.

BURY.—Jan. 11.—For erection, construction and completion of proposed Baptist chapel and school, Manchester Road. Mr. Thos. Nuttall, architect, 26 Market Street, Bury.

CARDIFF.—For rebuilding of Adam Street. Messrs. J. P. Jones, Richards & Budgen, architects, St. Mary Street, Cardiff.

CHRISTCHURCH.—Jan. 14.—For alterations and extensions to the engine and boiler-houses at Knapp Mill and building new filter-beds, building a water-tower at Southbourne, delivery of cast-iron pipes at Christchurch, delivery of valves, &c., at Christchurch. Mr. R. St. Geo. Moore, 17 Victoria Street, S.W.

COCKERMOUTH.—Jan. 13.—For erection of new banking premises and manager's house, for the Carlisle and Cumberland Banking Company, Limited. Mr. Geo. Dale Oliver, architect, Carlisle.

COLCHESTER.—For erection of two houses, Creffield Road, Messrs. Baker & May, architects, Head Street, Colchester.

CORK.—Jan. 9.—For new fixtures for the premises of Messrs. A. Grant & Co., Patrick Street and Grand Parade. Mr. James F. M'Mullen, architect, 30 South Mall, Cork.

CORK.—Jan. 14.—For erection of labourer's cottage. Mr. John Cotter, clerk, Board-room, Workhouse.

CORNWALL.—Jan. 16.—For alterations to "Gonvena," Wadebridge. Major Becher, on the premises.

COSHAM.—Jan. 11.—For enlargement of the girls' classroom at schools. Messrs. Rake & Cogswell, architects, Prudential Buildings, Portsmouth.

CROYDON.—Jan. 11.—For internal repairs, distempering, painting, &c., at infirmary, Mayday Road. Mr. Frederick West, surveyor, 23 Coombe Road, Croydon.

DENGEMARSH.—Jan. 22.—For erection of an officer's house and outbuildings for men at the coastguard station at Dengemars, near Dungeness, Kent. Director of Works Department, Admiralty, 21 Craven Street, Charing Cross, W.C.

DERBY.—Jan. 8.—For rebuilding the branch post office and sorting office at Midland Road, Derby, for the Commissioners of H.M. Works and Public Buildings. Messrs. Welch & Atkinson, 10 Lancaster Place, Strand.

DERBY.—Jan. 11.—For erection of urinal at the corner of Bradshaw Street. Mr. R. J. Harrison, borough engineer, Municipal Offices, Babington Lane, Derby.

EXETER.—Jan. 9.—For rebuilding St. David's Church, including the tower, close to the Great Western and South-Western stations, Exeter. Mr. W. D. Caroe, architect, 8A Whitehall Place, London, S.W.

EXETER.—Jan. 9.—For demolition of the existing structure of St. David's Church, Exeter. Rev. C. J. V. French, vicar.

EXMOUTH.—Jan. 12.—For erection of shop premises, Rolle Street. Mr. W. J. Morley, architect, 269. Swan Arcade, Bradford, Yorks.

GREAT HORTON.—Jan. 13.—For erection of jam works and houses, &c. Messrs. Samuel Jackson & Son, architects, &c., Tanfield Chambers, Bradford.

HALIFAX.—Jan. 8.—For erection of additions to Holy Trinity Boys' School, West Parade. Messrs. Jackson & Fox, architects, 22 George Street, Halifax.

HAMPSTEAD.—For erection of residential flats. Messrs. Percy Palgrave & Co., architects, 12 Victoria Street, S.W.

HARWICH.—Jan. 19.—For general repairs to the coastguard station. The Director of Works Department, Admiralty, 21 Craven Street, Charing Cross.

HOLBECK.—Jan. 11.—For erection of shed and alteration of closets at workhouse. Mr. Moore, union clerk, Holbeck, Leeds.

IRELAND.—Jan. 13.—For erection of a branch dairy factory at Newpark, Effin. Mr. P. Lynch, Charleville, Cork.

IRELAND.—Jan. 9.—For erection of a creamery, Tarmon, Knock, co. Clare. Mr. W. L. Stokes, Mulgrave Street, Limerick.

KEIGHLEY.—For erection of a Congregational School-Chapel in Oakworth Road. Mr. John Haggas, architect, North Street, Keighley.

KNOCK.—Jan. 9.—For erection of a creamery on the lands of Mr. Ml. Behan, at Tarmon, Knock, co. Clare. Mr. W. L. Stokes, Mulgrave Street, Limerick.

LEEDS.—Jan. 12.—For erection of a detached residence at Roundhay. Mr. W. Carby Hall, architect, Prudential Buildings, Park Row, Leeds.

LEICESTER.—Jan. 11.—For erection of a branch free library on the Belgrave Road Recreation Ground. Mr. Arthur H. Hind, architect, 3 Greyfriars, Leicester.

LEYTONSTONE.—Jan. 13.—For erection of a boiler house on workhouse premises. Mr. Fred. E. Hilleary, clerk, Union Road, Leytonstone, E.

LIGHTCLIFFE.—For erection of a residence and stabling. Mr. Joseph F. Walsh, architect, L. and Y. Bank Chambers, Halifax.

LIVERPOOL.—Jan. 12.—For erection of a warehouse at Liverpool, for the Manchester, Sheffield & Lincolnshire Railway Company. Mr. Oliver S. Holt, secretary, London Road Station, Manchester.

MANNINGHAM.—For conversion of four houses into houses and shops. Mr. Henry Hardaker, architect, Ivegate Chambers, T. New Ivegate, Bradford.

MARYPORT.—Jan. 8.—For erection of two shops and dwelling-house. Mr. C. Eaglesfield, architect, Maryport.

MEXBOROUGH.—Jan. 16.—For levelling and draining two school playgrounds, also for erection of wall and alterations, for the School Board. Mr. H. J. C. Reed, clerk, High Street, Mexborough.

MORLEY.—Jan. 13.—For erection of a house and shop in Queen Street. George B. Clegg, architect, 2 Peel Street, Morley.

NEWARK.—Jan. 8.—For erection of additional buildings to farms situate at North Muskham, erection of fencing on the farms at Muskham and part in Bathley. Mr. Fredk. B. Footitt, clerk and receiver, Newark.

NORTH SHIELDS.—Jan. 22.—For erection of new schools in Coach Lane. Messrs. Marshall & Dick, architects, 4 Northumberland Street, Newcastle-on-Tyne.

NOTTINGHAM.—For erection of two shops, new seating and other alterations and additions at Hockley Chapel. Mr. Henry Harper, 8 Beastmarket Hill, Nottingham.

PAISLEY.—Jan. 16.—For erection of public school at Carbrook Street, for 800 scholars. Mr. Charles Davidson, architect, Terrace Buildings, Paisley.

SHIPLEY.—Jan. 9.—For erection of ten cottages and of eleven cottages, and the forming and sewerage of roads. Messrs. Walker & Collinson, architects, 227 Swan Arcade, Bradford.

SKELMANTHORPE.—Jan. 21.—For erection of an engine-house and weaving-shed. Messrs. John Kirk & Sons, architects, Huddersfield.

SOWERBY.—Jan. 15.—For erection of a Methodist New Connexion chapel and Sunday school at Boulderclough. Messrs. Sutcliffe & Sutcliffe, architects, Todmorden.

STOKESBY-WITH-HERRINGBY.—Jan. 13.—For erection of a classroom and offices at the Board school. Mr. A. S. Hewitt, architect, 10 Regent Street, Yarmouth.

STRATFORD.—Jan. 26.—For erection of a block of school buildings and appurtenances, to be known as the Whalebone Lane schools. Mr. William Jacques, 2 Fen Court, E.C.

SWINDON.—Jan. 18.—For alterations and additions to the laundry buildings at workhouse. Mr. W. H. Read, Corn Exchange, Swindon.

THORNBURY.—Jan. 9.—For erection of a chapel, &c., in the burial ground. Mr. Samuel Fudge, architect, Thornbury, Gloucestershire.

WALES.—Jan. 18.—For erection of an infants' school at Bedlinog. Messrs. James & Morgan, architects, Charles Street Chambers, Cardiff.

WALES.—For erection of four shops and premises at Port Talbot. Messrs. Margrave & Peacock, architects and surveyors, 46 Wind Street, Swansea.

WALSALL.—Jan. 11.—For alterations and additions to houses, 13 and 14 Goodall Street, and workshop in rear. Mr. John R. Cooper, town clerk, Borough Offices, Walsall.

WESTON-SUPER-MARE.—Jan. 12.—For alterations and additions to Albert Memorial Schools. Mr. S. J. Wilde, architect, Boulevard Chambers, Weston-super-Mare.

WIMBLEDON.—Jan. 12.—For alterations and additions to the mortuary at the cemetery, Wimbledon. Mr. W. H. Whitfield, Council Offices, Broadway, Wimbledon.

WIMBLEDON.—Jan. 14.—For erection of five cottages in Hubert Road. Mr. Wm. Cooper, architect, 21 Havelock Road, Hastings.

WINCHESTER.—Jan. 25.—For additions, alterations and repairs at the prebendal house, 4 The Close, and for the conversion of the same into judges' lodgings, for the Very Rev. the Dean and Chapter. Mr. J. B. Colson, architect, 46 Jewry Street, Winchester.

WINCHFIELD.—Jan. 29.—For erection of additional vagrant wards at the union house. Mr. F. S. Chandler, clerk, Oldham.

THE Liverpool and London and Globe Insurance Company have issued the edition of their "Electrical Installation Rules" for 1897. The rules are an epitome of electrical engineering science in its practical aspects, and acquaintance with them is indispensable for all who have to arrange installations. They are expressed in clear language, and cannot be too widely known.

## VARIETIES.

THE fine eastern window at Heckington parish church is to be filled with stained glass, at a cost of about 1,400*l*.

A WINDOW to the memory of the late Mr. Alexander Macmillan, the publisher, and to his son, the late Mr. Malcolm Kingsley Macmillan, has been placed in the north aisle of Bramshott Church, in Hampshire, in which parish Mr. Macmillan had a residence. The window is the work of Mr. H. Holiday, of Hampstead.

A NEW hall for the Perth Lodge of Good Templars was opened by Bailie Wright last week. The hall cost 1,200*l*., and is seated for 500.

THE Bournemouth Town Council have again had before them the question of the construction of an undercliff drive at Bournemouth. Since the recent landslip on the east cliff both the tenants and Sir George Meyrick, who have hitherto not seemed favourable to the control of the cliffs being in the hands of the Corporation, have become alarmed at the danger of leaving them any longer unattended to. Sir George has written a letter to the Town Council, by his solicitors, in which he expresses himself in favour of giving the town a lease, or an appropriation, of the cliffs, but he desired first to be informed as to what the Town Council definitely proposed to do in the way of preservation in case he handed the cliffs over to their control. The Town Council have discussed the question in committee, and instructed their surveyor to bring up a scheme for the preservation of the cliffs and an undercliff drive for consideration at the next meeting.

IT has been resolved to convert the Evesham Institute into a free public library.

CLEVELAND HOUSE, St. James's Square, once the town residence of the Dukes of Cleveland, will be offered for sale at Tokenhouse Yard in the course of next month. The Dukes of Cleveland had a long and distinguished ancestry, and were the owners of Battle Abbey, near Hastings, for which town the last duke was member of Parliament before his accession to the peerage. The late Duchess of Cleveland compiled a very interesting work entitled "The Roll of Battle Abbey," dealing with some of the earliest events in the family history of the oldest peerages of England.

LADY HARRIS has commissioned Mr. Joseph Whitehead, of Westminster, to execute a memorial of the late Sir Augustus, to be placed over his tomb in Brompton Cemetery. The

monument will consist of a white marble pillar, surmounted by a life-size bust of the deceased. At one side of the pillar stands a female figure of Fame, crowning the bust with a wreath of laurel. On the other side is a trophy emblematical of music and drama, the whole rising from a beautifully-moulded plinth. The monument will be completed in about six months.

A NEW post office was opened at Harrogate on the 4th inst. The building, which is Perpendicular in style, is built of stone, and has cost 9,000*l*. The architect is Mr. H. Turner, of H.M. Office of Works, Whitehall.

PLANS have been prepared by Mr. E. R. Robson for the erection of a kursaal and baths at the south end of the Winter Garden, Cheltenham, and for the conversion of the existing Winter Garden into Municipal Offices and Winter Garden. The cost is estimated at 50,000*l*. if all the work be done at once, and 53,000*l*. if done in sections.

NEW premises for the Scottish Co-operative Wholesale Society, which have been erected in Morrison Street, Glasgow, at a cost of 90,000*l*., were formally opened on Saturday last.

CONSIDERABLE anxiety being felt as to the safety of the south-west pinnacle of the tower of the old church of Tamworth, the vicar and churchwardens considered it advisable to take the opinion of Mr. Basil Champneys, who has made a careful survey. In a report Mr. Champneys states that in regard to the turret there is a considerable inclination towards the west, commencing above the second crotchet from the top and increasing towards the apex. The mortar has been so generally removed by the action of the weather that the whole upper portion of the spirelet seems to depend for stability on mere weight and balance, which is rendered more precarious by the decay of the stonework at a critical point on either side. He advised that the top of the spirelet be at once taken down to the level of the bed above the second crotchet from the top. Steps are being taken to have the more dangerous portion of the pinnacle at once removed, and when funds are obtained the remainder will be taken down and the whole re-erected in a substantial manner. The three other pinnacles of the tower have all been rebuilt during the present century.

THE next ordinary meeting of the Institution of Civil Engineers will take place on Tuesday next, January 12, at 8 P.M., when a paper will be read, with a view to discussion, on "Superheated-steam Engine Trials," by Professor W. Ripper, M.Inst.C.E. At this meeting the monthly ballot for members will be taken. Students' meeting, Friday, January 15, at 8 P.M.

MR. WILLIAM GEORGE AYRES, builder, of Epsom, was attacked by four men in Mill Road, Epsom, on Monday night, rendered insensible and robbed of about 40*l*. and his watch. Mr. Ayres, who is in a precarious condition, is able to give only an indistinct description of his assailants.

A NEW monastery, which will be known as St. Phillip's College, founded by the Servite Fathers at Begbroke, near Oxford, was opened on the 5th inst. The building is intended solely for the training and education of novices and students of the Order.

THE slaters in Aberdeen have struck work in consequence of a dispute that has arisen in regard to the bylaws. The workmen desired to have put into operation a series of regulations as to the payment for overtime and country work, &c., that had fallen into disuse, but the masters declined to accept the bylaws or even to discuss them with the men. About 100 slaters are affected by the strike, which is likely to retard building operations if it is not amicably settled.

A STAINED-GLASS window has been placed in the side chapel of Wantage Church as a tribute to the memory of the late Dean of Lincoln, who for many years laboured as vicar of that town. It represents figures of three prelates—namely, St. Birinus, Bishop of Dorchester, who died A.D. 650; St. Wulstan, Bishop of Worcester, 1062; and St. Hugh, Bishop of Lincoln, 1186. These are the three dioceses in which the late Dean worked.

THE new public school at Thornliebank, which takes the place of the one that was burned to the ground two years ago, was formally opened on Tuesday last. The school, which is built in the English Gothic style of architecture, cost about 10,000*l*., and has accommodation for 600 children.

ON Tuesday afternoon the new public schools erected by the Aberlour School Board were opened with some ceremony. The new schools are situated opposite the Fleming Hall, and the principal approach to the new buildings is from the square of the village. Entering by the main door, which is at the west, the lobby, to the right and left of which there are teachers' retiring rooms, is reached, and it leads into the central hall, measuring 40 feet by 27 feet by 24 feet high. It is lined with birdseye maple, is well lighted, and is to be furnished with historical pictures. From the hall the various class-rooms are entered. These are all airy and well lighted. Besides these, there are

cloak and retiring rooms. Outside shelter shades have been provided for boys and girls. The cost of the buildings is about 3,500*l*., and they are built from plans supplied by Mr. Watt, Aberdeen.

THE Leatherhead Water Company are about to construct an additional reservoir, with a capacity of 1,000,000 gallons.

THE president of the Municipal Officers' Association, the Right Hon. the Lord Mayor of London, supported by Sir J. B. Monckton, Mr. C. J. Stewart, clerk of the London County Council, Mr. H. H. Crawford, City solicitor, and others, has kindly consented to preside at the annual dinner to be held in London on Saturday, February 27. This date is arranged to meet the convenience of town clerks attending the Municipal Corporations' Association dinner on the previous evening. The conference of associations and societies promoting the Local Authorities Officers' Superannuation Bill has, through its delegates, arranged to co-operate with the Municipal Officers' Association so that every branch of the municipal service may be represented. Applications for tickets (5*s*. each) should be addressed to the hon. secretary, Mr. C. J. F. Carnell, 33 Paulet Road, Camberwell, S.E.

### TRADE NOTES.

AT the Meltham, Yorks, District Council offices on Christmas Eve a new four-dialled illuminated turret striking clock was set in motion by Mr. Councillor John Mellor, chairman of the District Council, which has been presented by Mr. J. Brooke, J.P., Meltham, the necessary work having been done by Messrs. Wm. Potts & Sons, clock manufacturers, of Leeds and Newcastle, from instructions received from the architect, Mr. Wm. Carter, Meltham, who designed the hands and dials. The company afterwards partook of a knife-and-fork tea, when a vote of thanks was passed to Mr. Brooke for his generous gift.

THE new infirmary for the Sisters of Bethany, Bournemouth, is being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

MESSRS. PECKETT & SONS, Atlas Locomotive Works, Bristol, have sent us one of their abridged illustrated lists of tank engines suitable for ironworks, contractors, &c. The illustrations, which are admirably printed, convey an accurate idea of the various engines supplied by the firm, and each one is accompanied by full particulars as to dimensions of various

parts, tractive force, and the purposes for which the engine is specially adapted.

THE Enamelled Metal Decoration Company, of Queen Victoria Street, have just supplied their decorative ironwork for the following list of public places:—Trocadero Restaurant; Mecca, Mark Lane; Freemasons' Arms, Long Acre; Commercial Sale Rooms, Mark Lane; Westminster Baths; Southend Public Baths; New River Company's offices, Clerkenwell. They have also been specified for the Poplar Hospital and various other important buildings.

WE understand that Mr. H. C. Eyres, London agent of the Coalbrookdale Company, Limited, has resigned his position there, and assumed the position of manager of the architectural department in London of the Falkirk Iron Company.

### BUILDING AND BUILDERS.

THE erection of new headquarters and drill hall in St. James's Street, Leeds, for the Leeds Volunteer Medical Staff Corps, has just been commenced. The drill hall will be 68 feet in length and will have a width of 35 feet, with a wood block floor resting on a bed of concrete. The roof is to be of wrought iron, with a glass lantern in which adequate provision for ventilation, by means of windows, will be made. The other buildings will comprise quartermaster's office, stores and residence of the staff-sergeant, while outside the main block a lavatory will be fixed and a shed erected for the service waggon. The whole of the work is to be done in accordance with plans prepared by Mr. William Bakewell, of Leeds.

THE United Methodist Free Church has decided to build a permanent church at Ipswich, at a cost of 3,000*l.*, to replace the existing iron structure. The connexional authorities have given permission to build as soon as 1,500*l.* is raised.

THE Free Methodists are building a chapel and school at Frodsham; and at Dunham Hill, in the same circuit, they have secured a site for a chapel, the erection of which is shortly to be commenced.

EUROPE contains 560 miles of electric railway, with 25,000 horse-power, and 1,747 cars. In the United States there are, according to the latest figures, 12,133 miles of road (more than twenty-one times that of Europe), with a total of 34,971 cars.

### THE BELLS OF ST. SAVIOUR'S, SOUTHWARK.

IN the tower of St. Saviour's, Southwark, hang twelve bells, deemed by many experts the finest ringing peal in the world. The tenor exceeds 2½ tons in weight, and, with nine of the sister bells, dates back more than a century and a half to the year 1735, when they were recast from an older peal made in 1424 out of the metal of seven bells of whose remote history nothing remains save that they bore respectively the names "Mary," "Stephen," "Anne," "Lawrence," "Vincent," "Nicholas" and "Augustine."

From 1735 down to the inception of the restoration the peal of twelve were handled alternately by the two great ringing societies of the Metropolis, the "Ancient Society of College Youths" and the "Royal Cumberland Society," who vied with each other in creating an unsurpassed record of marvellous change-ringing performances, many of which are, or were, to be found inscribed on the walls of the belfry.

But for long has reigned the silence. When is it to be broken? If, as commonly reported, a dearth of funds is the difficulty, surely during the present year, when there are to be new bells by the hundred, money can be found to put in order this grand and time-honoured peal, the costliest treasure of St. Saviour's Church.

### THE QUEEN'S VISIT TO CIMIEZ.

THE Excelsior Hotel Regina, at Cimiez, where the Queen is to stay during her visit to the Continent early in March, is now rapidly nearing completion. That portion which has been retained for the Queen comprises some 150 rooms, and those which are set apart for Her Majesty's particular use include a grand and spacious reception-room, a commodious dining-room, and a dainty salon. The prevailing colours of the reception-room are gold and white, the style being Empire. The dining-room, in striking contrast, is exceedingly rich in tone. Carried out on Elizabethan lines, the rich red velvet is in pleasing harmony with the warm tints of the decorations. In the case of the Louis Seize salon, one cannot help being struck with the blending of the delicate fawn of the carpet and the blue silk, which has been, it is worth noting, specially designed and woven for this apartment, being the one which the Queen will more generally use.

The Princess's suite of rooms is on the first floor, and corresponds in plan with that of Her Majesty, furniture and decoration being carried out on similar lines.

# THE NEW EXPANDED METAL

*Meshes from 1/8th in. to 6 in. wide. Strands from 24 B.W.G. to 3/16th in. thickness of steel.*

**FOR BUILDING CONSTRUCTION**, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

**FOR SOLID PLASTER PARTITIONS**, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

**FOR FIREPROOF LATHING**, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

**FOR CONCRETE FLOORS WITH EXPANDED METAL**.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

**FOR EXTERIOR WALLS OF BUILDINGS**.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

**FOR FENCING, TREE GUARDS, WINDOW GUARDS**, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

**ORNAMENTAL. STRONG. CHEAP.**

**OTHER USES FOR EXPANDED METAL**.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away. Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

**BRASS, ALUMINIUM**, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

**CATALOGUES AND PRICE LISTS** can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

**THE EXPANDED METAL COMPANY, LTD.,**

**39 UPPER THAMES STREET, LONDON, E.C.**

Works—WEST HARTLEPOOL.

Telephone No. 1829.

An indication of the Queen's well-known love of music is found in the presence of an English-made piano of an approved maker, which occupies a conspicuous place in the salon.

Altogether, the hotel includes about 500 rooms, and the furniture of this great building has been exclusively entrusted to Messrs. S. J. Waring & Sons, Limited, of Oxford Street, London, who, it will be remembered, had so important a work at the Hotel Cecil.

### THE PENRHYN QUARRY STRIKE.

THE correspondent of the *Times* says that the situation in the Penrhyn Quarry strike has not changed, nor is it likely to change for some little time. Meanwhile, the fact that Lord Penrhyn, through his chief manager Mr. Young, has formally closed the quarries seems to have been taken in many quarters as a proof that he does not intend to quarry slate at Bethesda ever again. It is not necessary to make any inquiry of Lord Penrhyn to be able to say that, as a matter of course, he has no such idea in his mind. For him to close the quarries for ever and to ruin a populous district and a town with some 7,000 inhabitants would be not merely inhuman, but financially suicidal; for apart from the fact that the yearly profits of the quarries are large, the greater part, if not the whole of the district is the property of Lord Penrhyn. Moreover, his action in closing the quarries is precisely analogous to that which has been taken before, and will no doubt be taken again by other employers of labour in like circumstances. The facts, be the merits what they may, are plain enough. Since September of last year practically the whole of the able-bodied men in the quarries have been idle. But the few men who did not strike, being for the most part old men and virtual pensioners, were kept on in employment to the end of the year. There was a certain amount of work to be done in the way of working down to Port Penrhyn slates that were ready for the market, and, no doubt, there was a good deal to be done in the way of clearing away rubbish and bad rock. That, however, has come to an end, and the result is that the old men have been placed on a pension list and the remainder have been discharged with gratuities. But this simply means that, so long as the deadlock between Lord Penrhyn and his quarrymen continues, there is no need for any men in the quarries. The slate rock, which has been in a condition of readiness to be quarried for some thousands of years, may be trusted to remain so ready for an indefinite period without aid

from man. In fact, apart from the question whether an employer ought or ought not to concede certain terms to his workmen, there are but two things which he can do, unless he is inclined towards arbitration, when his men strike. He may either fill their places, as Mr. Livesey filled the places of the men who struck at the South Metropolitan Gasworks, or he may let his works lie idle until, from his point of view, the men regain their senses, or, from the men's point of view, he is compelled to take a reasonable view of the situation.

The difference between the Penrhyn quarries and the mass of other places of employment is, first, that the peculiar skill of the men employed is such that it would be exceedingly difficult to supply their place, and, secondly, that the quarries, unlike collieries and many other enterprises, suffer little or nothing by being left alone. In the first point lies the strength of the men, and they know it. Theirs is an almost hereditary skill, and they have every right to sell it to the best advantage. In the second point lies the strength of the employer, who needs not to fear that, when the strike comes to an end, he will find, as many a Durham coalowner found when the Durham coal strike ended, that the subject-matter of his enterprise has become worthless. These matters are pointed out because they are essential to an understanding of the situation, which is simply that the forces on both sides are strong, and the issues real and not merely nominal. But that the deadlock will end some day is quite certain. Equally certain is it that strikes in the quarries, whether at Penrhyn, or in Mr. Assheton Smith's quarries at Llanberis, or at Festiniog are usually obstinate affairs. What form the solution may take is another matter. It may be that Lord Penrhyn will follow the example of a neighbouring quarry-owner, who, during a similar strike some years ago, adopted a bold policy. For two days in each month employment at the quarries was offered on the owner's terms. Failing acceptance, the men had another month's idleness to look forward to. This went on for some months, and then an agreement was reached. I do not commend this course or disapprove it; I simply state that it was followed. Or, as soon as the excitement arising out of the efforts of the Board of Trade has cooled down, there might easily be a conference of employer and employed, attended by a competent shorthand writer—one of the legal shorthand writers from the Royal Courts, for example, whom no sane man would accuse of partiality. But at present neither side is in the most amiable of moods, and, though the deadlock cannot be permanent, it is likely to last a month or more.

THE RETURN FROM THE CHASE.

CATHEDRAL SERIES, NO. 2.—LINCOLN: NAVE.

EATON HALL.

## TESTS OF CONCRETE.

SOME important tests of concrete were recently made at McGill University, Montreal, by Messrs. Theo. Denis, G. G. Hare and Carl Reinhardt, the results of which will be found below. The experiments are rendered particularly interesting by the fact that the general opinion of the effect of water on cement is somewhat erroneous. Following is the report of the tests as presented at a meeting of the Canadian Society of Civil Engineers:—

Of late, monolithic works of great importance have been carried out, and every day concrete, as building material, is creeping to a foremost place.

Although cement testing proper has been subjected to elaborate scientific and practical investigations, very few researches, and especially normally conducted researches, have been made on the strength and behaviour of concrete and betons. This probably is due to the fact that for such experiments heavy and costly apparatus is needed. Investigations on small specimens would be useless, and conditions approaching as nearly as possible to practice have to be followed.

The following are the results obtained from a series of experiments made by students of McGill University, 1895-96.

The object of this first series of experiments is to determine the effect of different per cents. of water on the strength of the concrete. The limits were 16 and 30 per cent. of water, by weight of cement and sand, which are beyond the extremes of practice on both sides.

*Cement.*

The cement used was, of course, the same brand throughout the series. It was a German Portland of good quality, slow setting, on which separate sand tests were made in connection with this series. The results are tabulated below.

*Sand.*

This was clean, coarse, angular, dry sand of good quality, of slightly higher grade than usual practice.

*Stone.*

This was broken limestone of such size that the pieces would have passed through a ring  $1\frac{1}{4}$  inch diameter. They were unscreened, and just as they came out of the breaker. Consequently a slight amount of dust was mixed with them. They had to be broken a little smaller than in actual practice. The blocks of concrete being only 1 cubic foot, it was thought that more accurate results would be obtained in this way.

*Moulds.*

The moulds were made of  $\frac{3}{4}$ -inch plank, lined with sheet zinc. They were 5 feet long, 1 foot high and 1 foot wide, divided into four compartments, which would mould four cubes at once, of dimensions 1 by 1 by 1 foot, forming specimens large enough to investigate seriously upon. These were removed by unscrewing one side of the box and sliding them out. Care had to be taken to oil the sides of the moulds slightly before ramming the mixture in them, to avoid trouble in getting them out.

*Conditions of Mixture and Proportions.*

The proportions adopted for this series were one of cement, two of sand and four of stones, by weight, the proportion of water being based on the weight of sand and cement.

The cement and the sand were first thoroughly mixed dry, then the water added gradually. The stones were then thrown on this mortar, spread out, and the whole vigorously and very thoroughly mixed. The fresh concrete was then placed into the moulds and rammed in  $1\frac{1}{2}$  to 2-inch layers.

*Ramming.*

The rammer was a block of hard wood 2 feet long by 2 by 2 inches, with a lathe-turned handle. It was not very easy with this to ram uniformly, even throughout one block, and this is one of the main sources of discrepancies in this series of experiments.

It was thought that a reduction of the breaking loads to a standard weight of the blocks would be only fair, and would slightly improve the results.

*Grouping of Tests.*

The tests were made at one week, four weeks and two months, and the results grouped accordingly, that is to say, the one-week tests, with different per cent. of water, compare between themselves, four weeks and two months likewise. Parallels between the results, at different ages, cannot be drawn on

# ELECTRIC LIGHT

## THE NEW CONDUIT SYSTEM

New Buildings can now be fitted with Insulated Iron Tubes whilst in course of erection, ready for cables and wires to be drawn through at any future period.

### STRODE & CO.

HEAD OFFICE AND WORKS—

48 OSNABURGH ST., REGENT'S PARK, LONDON, N.W.

account of some specimens having been prepared under widely different conditions. For instance, the results at two months are exceedingly low as compared with those obtained at one and four weeks. This is due to the fact that these two months' specimens were the first prepared of all, and this before the cemented trough in which they were to be immersed was completed. Consequently, they were kept eight to ten days longer than the others in the dry air of the laboratory, which seems to have had a disastrous effect on them. But in spite of these slight drawbacks, the annexed table shows that up to 24 per cent. the percentage of water has not a very great effect on the strength. This is an important point, for below 20 per cent. the mortar obtained is rather dry and very difficult to handle.

But beyond this limit of 24 per cent. a greater proportion of water seems to weaken the concrete considerably.

This limit is very sharply defined in the adjoining table, where an additional 2 per cent. of water from 24 to 26 per cent. weakens the concrete by almost one-half for the one-week tests. It is, however, interesting to notice that strength is almost completely recovered with time, the four-weeks test showing the weakening limit to be between 26 and 28 per cent., and the two months between 28 and 30 per cent. So that if immediate strength be not required of the concrete structure, 28 per cent. of water will not affect the ultimate resistance if allowed to stand two months.

In the parallel sand and cement tests the weak line is not so sharply defined, but yet it is sufficiently so to show that the same statement applies. The tests in this case show a marked weakening between 14 and 16 per cent. of water for the one week, which strength is ultimately recovered, as is shown by the four-weeks and two-months test.

The low limit of 14 per cent., as compared with 24 for the concrete is probably due to the fact that the stones of the concrete, on account of their porosity, absorb a part of the water.

The table shows that the great density is obtained with 16 and 18 per cent. The weights of the cubes beyond this decrease up to 24 and 26 per cent., where they are again nearly equal in density to the 16 and 18 per cent. of water. Therefore this 24 and 26 per cent. seems to be the point where the best practical results are obtained, because 16 and 18 per cent. make up too dry a concrete to allow of easy handling.

Another point incidentally comes up. Attention has been drawn to the poor results obtained by the same tests and reason of long exposure to dry air given. This shows up a very

important point, namely, the necessity of covering up carefully all concrete and cement works exposed for any length of time to dry air and sun. The bad effect of these agents is plainly demonstrated, and it is doubtful whether much strength would ultimately have been recovered.

It is also interesting to notice the results obtained by the concretes made of 1 part of cement, 2 of sand and 5 of stones, and 1 cement, 2 sand and 6 of stones. The specimens of these compositions gave results equal to concretes 1, 2, 4, showing that for strength they are as good as the ones containing a less proportion of stones, while being much more economical.

These experiments are as yet very incomplete. But it is hoped that the researches in this subject will be continued and valuable information for the engineer in practice derived from them.

## WIRED GLASS.

ON November 1, 1893, the committee of science and the arts of the Franklin Institute adopted a report recommending the award to Frank Shuman of the John Scott legacy premium and medal for his machine and process for producing wired glass. This report at some length discusses the varied uses to which wired glass can be put and its superiority in numerous applications over the ordinary glass. The question of the fire-retarding qualities of the wired glass, however, was passed over without special comment.

In December, 1893, Mr. W. S. Lemmon, inspector of the Newark (N. J.) committee of the Underwriters' Association of the Middle Department, requested an owner in that city to place wired glass in two windows of his warehouse to protect it from external exposure. This resulted in a test of the fire-retarding quality of wired glass in Newark, which is described by Mr. Lemmon in a letter as follows:—

"A small brick building, about 6 by 10 feet, was built, in which were placed the following windows, all glazed with wired glass  $\frac{1}{4}$  inch in thickness:—One 20 by 80 inches, one 28 by 80 inches, and one 30 by 80 inches. In the building a fire was made for half an hour, a high degree of heat being developed. When the glass became red-hot, cold water was turned on by the city fire department, under 60 lbs. pressure, through the regular fire hose. In addition to the throwing of water on the glass, the chief of the fire department tried, without success, to throw a half brick through the glass while it was red-hot; this was to show the result of falling walls against the glass when in actual use for exposure purposes."

In this test the frames holding the wired glass in place were constructed of angle iron and of galvanised sheet iron. The intense heat warped and bent the metal work, but the glass did not fall out on account of the warping. Mr. Lemmon further reports that since December 1893 nearly eighty windows in his city had been constructed of wired glass in metal frames to protect buildings against outside exposure, and in a number of cases actual fire tests proved the value of the wired glass for the purpose designated.

In Philadelphia, besides being used in a number of fire doors in stairway and elevator shafts, wired glass partitions have been erected in a number of buildings.

At the request of the Mississippi Glass Company, which controls the manufacture of wired glass, a series of tests of the fire-resisting qualities of wired glass was made, the main test

being described in the following report made to the committee of the Philadelphia Fire Underwriters' Association:—

A brick test-house, about 3 by 4 feet inside measurement and 9 feet high, was constructed in the yard of the Pennsylvania Ironworks, near Fiftieth Street and Merion Avenue. In one side of this structure a wired-glass window was fastened in a wooden frame covered with lock-jointed tin. In another side a Philadelphia standard fire door was hung. The upper part of this door had a pane of wired glass, 18 by 24 inches, set into a wooden metal-covered frame. The entire roof of the test-house was replaced by a skylight, the sash being constructed of wood, metal covered, one side of this skylight being provided with three lights of quarter-inch ordinary rough glass, the other side with three lights of wired glass. The entire structure was constructed by John J. Husband in accordance with specifications furnished by the secretary. The wired glass used was  $\frac{1}{4}$  inch thick, and was manufactured by the Mississippi Glass Company, of St. Louis.

In order to make the fire test as severe as possible, iron grate bars were placed in the bottom of the test-house and openings were left in the wall near the ground for free draught. The test-house was filled for two-thirds of its height with wood, approximately one-half cord being used. After treating the wood with a liberal allowance of coal oil and resin the fire was started. In a few minutes the ordinary rough glass in the skylight cracked, and pieces began to fall into the fire. The wired glass in the fire-door soon became red-hot, so that a piece of paper held against it on the outside was easily ignited. The three plates of wired glass in skylight, subjected to the entire heat of the fire, also became red-hot, but retained their positions throughout the test. At the end of thirty minutes water was thrown on the fire and also on the hot glass. After the fire was extinguished the three plates of glass in the skylight were found to be cracked into countless pieces, but still adhering together, forming one sheet. The window light, which, as the result showed, was not properly secured to the frame, was found to be of the same condition as skylight glass, excepting that a large crack had developed. The plate of glass in the standard fire door was cracked the same as the skylight, but having been well secured into the door frame it did not give way. The action of the fire on the wooden metal-covered skylight and window frame showed conclusively that this class of construction is far superior to iron framing, no warping or giving way of any portion of the frames being noticed. The fire-door in

direct contact with the fire showed but little buckling on the inner side and no signs of giving way. On removing the tin covering it was found, however, that the inner layer of 1-inch boards was completely charred through, but that the second layer was only slightly damaged.

The conclusions to be drawn from the test appear to be as follows :—

1. Wired glass can safely be used in skylights, and in such situations will withstand a severe fire and will not give way when water is thrown on it. A wooden framing for skylight, covered with tin, all seams lock-jointed and concealed-nailed, is superior in fire-resisting quality to iron framing.

2. Wired glass in wooden sash, covered with tin, all seams lock-jointed and concealed-nailed, can safely be used for windows towards an external exposure.

3. Wired glass can safely be used in fire doors to elevator shafts and stairway towers where it is necessary to light said shafts.

4. In office buildings, hotels, &c., where it is undesirable to have elevator shafts entirely enclosed and dark, wired glass permanently built into a brick or terra-cotta shaft, or arranged in a wood metal-covered frame, can safely be used.

5. Wired-glass plates securely fastened in standard fire shutters can safely be used toward an external exposure. In this case, the fact that a possible fire in a building, all windows of which are protected by fire shutters, can much more readily be detected from the outside through the wired glass, is of importance.

The President of the Boston Manufacturers' Mutual Insurance Company witnessed a test of the fire-retarding quality of wired glass in Boston. A circular issued by him runs as follows :—

There are many places in our risks where it would be very desirable to brick up windows if the light could be spared, but where the requirements for light render it necessary to leave the spaces as they are, often protected with automatic shutters, but sometimes under such conditions that the risk must remain unguarded.

The intervention of wired glass will, in such cases and in many others, suffice to retard the passage of fire in a fully adequate manner. This glass, originally invented for skylights, is now being applied to fire-retardent purposes. It has been introduced in some of the western cities around elevators in place of the ordinary iron cages. It may be used in our risks for similar purposes.

First, it may be remarked that while at the beginning, when used for skylights, some defects were disclosed in the differential strain on the glass and the wire under the heat of the sun, that fault is claimed to have been entirely removed. It would not affect the present purpose.

Second, a test of the fire-resisting properties of this wired glass was witnessed by the undersigned in the vicinity of the Boston Plate Glass Company on A Street, South Boston. What might be called an iron stove was constructed in the form of a fireplace with a wired glass-blower. It was 3 feet high, 1 foot in depth from face to back, 2 feet wide on front. It was set up on bricks, so as to give a draught all around, and was open at the top. The plate of glass which formed the blower was 18 by 34 inches. This fireplace was filled to the top with hard wood and resinous wood upon which kerosene oil had been poured, which was set on fire, resting in front against the glass.

The first effect was to cover the inside of the glass with soot, but after about fifteen minutes the soot was burned off, leaving the glass clear as at the beginning. The stove was recharged, and this intense heat affected the glass for nearly half an hour. A stream of cold water was then thrown on the glass from the outside. Presently the fire was put out with another stream, and the glass was showered from within. The effect was to crack the glass into millions of pieces, but, being held by the wire, none fell out, neither did the glass spring or bend. It held its place even while the iron of the stove was twisted and bent.

This glass has already been placed at dangerous points in a few of our risks, and may be recommended in all places where the light must be retained, but where it is desirable to put in a fire-retardent material. We have as yet no experience in the test of this kind of window under actual fire.

The glass on which these tests have been made, which is intended for windows or doors, is  $\frac{1}{4}$  inch thick, but it is made up to 1 inch in thickness. The  $\frac{1}{4}$  inch is, of course, too heavy for the ordinary window-frame, nor should any wood be used in the setting of the glass unless absolutely protected. Instructions will be given for placing it in metal frames. This glass is made up to 1 inch in thickness, and that thickness, properly supported beneath, might in many places be suitable to put into floors for the purpose of giving light in dark basements or elsewhere, of course being placed so as not to be subjected to trucks with iron wheels or other danger of chipping.

It is clearly indicated from the above that wired glass can

safely be used as a fire retardant in numerous ways. Metal-covered wood framing is superior to iron frames for holding the glass in place. The capability of the wired glass to withstand a temperature beyond the melting point of glass appears to be attributable to the fact that the network of wire in the glass acts as a good conductor of heat, and thereby prevents the accumulation of sufficient heat to melt the glass; and although it may thereby be softened and rendered pliable, the network of wire prevents the glass from giving way by reason of its own weight when softened by the heat.

### THE TIMBER TRADE OF 1896.

THE building trade of Bristol has been brisker than for the past five years, and while prices have been higher owing to the advance in the value of material, especially timber, the workmen in all branches have been well employed, and plasterers and painters throughout the summer months were very busy indeed. The increased work has chiefly been in commercial buildings.

The timber trade in the Hartlepoons has been exceptionally brisk. The import is the largest on record, amounting for the eleven months of the year to end of November to 383,591 loads, as against 348,226 loads in the same period of 1895. The consumptive demand has been large, alike for ship and house building woods and mining timbers, and stocks of all classes are small, in spite of the large import. Prices have advanced by about 25 per cent. all round, and contracts for next year have been closed at satisfactory figures.

The year has been a most satisfactory one on the Humber. The total imports at Hull fall not far short of 750,000 loads. This shows an enormous and unprecedented increase, and the same terms accurately describe the advance at Grimsby also. Prices now paid are an advance upon those current a year ago.

Messrs. Allison, Cousland & Co., Glasgow, report that the year just finished has witnessed a remarkable activity in the timber trade. Imports all round were heavy, but there was an excellent demand, and stocks were rapidly worked off. The season opened with freights about last year's figures, and the imports were heavy, but with a sharp advance in September they were gradually curtailed, thereby materially strengthening the position of stocks on hand. Prices showed a steady and continuous rise to the end of the year. Several features of outstanding

interest fall to be noted. The gradual displacement of yellow pine in the log, and the expansion of the trade in deals and boards are very noticeable. The position of teak also calls for remark. It was sold in January at 8*l.* 15*s.*, and the price now is 12*l.* to 12*l.* 5*s.* Quite a feature also was the number of small contracts entered into on account of Canadian shippers, the benefits from which were very questionable. Housebuilding and shipbuilding being our principal wood-consuming industries, the timber trade participated in the activity which characterised these trades throughout the year. The cabinet and box-making trades were also busy.

According to Messrs. Churchill & Sim, London, the figures of the importation of wood into the United Kingdom show very forcibly the remarkable character of the trade during 1896. The total quantities are far the largest of which we have a record in recent years, and the prolific supply, so far from overpowering or deadening the consuming markets, has been coincident with a rise in values which, while beginning quietly and continuing steadily with no element of excitement for the greater part of the year, has attained to something of fever heat in the closing days of December. The causes of this expansion and improvement in the trade, being even now somewhat obscure and prosaic, were not largely foreseen a year ago. The stocks in this and other consuming countries were then small, and there was a definite revival in trade. Buyers, therefore, were prepared to make purchases, and shippers, having a considerable output to deal with, made no effort to lift prices beyond their reach. The result was an immense business in January last, at a very moderate increase on the cost of the 1895 importations. Some signs of exhaustion and nervousness followed, but markets were held firmly throughout this phase, and an under-current of quiet buying, soon resumed, carried the trade through the first half of the year at a gradual improvement of the opening prices. From that point shippers began to understand that they were masters of the position, and buyers were rather unwillingly dragged upwards to their purchases till October. Then, partly startled by a squeeze in freight rates, and wholly satisfied with the retail demand which was carrying off their stocks, they, too, took alarm at the prospects of dearer supplies in the new year, and throughout November and December there was a rush to buy for forward shipment at whatever prices were necessary; a disposition of which foreign shippers have taken full advantage. The trade has shown a steady maintenance of good prices. This was due to moderate and well-regulated supplies, good consumption and the strong

position adopted by importers in not unduly pressing sales. So far as large, good logs were concerned, prices showed an increasing firmness, and are now rather higher than at the beginning of last year. Small wood relapsed slightly in the autumn, but is now steady. The total quantity landed of the six leading descriptions amounted to 27,247 logs, as against 25,075 logs in the previous year, and as consumption absorbed 31,617 logs, stocks are reduced to 9,506 logs, and have not been so low since 1889. The actual quantity remaining in importers' hands is exceptionally small and consists exclusively of recent arrivals. No heavy shipments are anticipated, and the strength of the market lies in the fact that, owing to the higher prices, yard-keepers, instead of buying freely for stock, only fill immediate wants and are, therefore, always ready to purchase.

According to Messrs. Farnworth & Jardine, of Liverpool, the business of the wood trade in this market during the past season has been of a more satisfactory character than for several preceding years, greatly aided by the extremely low rates of ocean freights. In colonial and Baltic goods the volume of business has increased, and the consumption (especially of some of the leading articles) has shown a marked expansion. The stocks held over are not beyond the requirements of the trade. Values have been well maintained, with generally an upward tendency. The building trade has been very active. In mahogany and other furniture woods the business has also been of a satisfactory nature—an active market and high values.

Messrs. Foy, Morgan & Co., London, say:—The past year has been exceptionally favourable for the timber trade, prices in almost all departments having slowly hardened until the close of the season. All stockholders have consequently realised easier and more liberal profits, while importing firms have, during a period which at one time seemed hazardous owing to the increased cost, unexpectedly reaped a harvest to which there is no parallel later than 1888. The grounds for the satisfactory nature of last year's business and the increased cost of next season's supplies are practically the same, being quite general and not merely local. Among them the most prominent have been, first, the unusually open weather last winter and spring, which permitted building operations to proceed uninterrupted, stimulating consumption and leading to a considerable depletion of customary stocks throughout the country; secondly, the unexpectedly cheap freights ruling in the spring and summer, which allowed the gap in stocks here to be filled at an almost imperceptible increase in cost, whereby affording

the merchants the opportunity, while the demand continued unabated, of an easy turnover at a profit somewhat more liberal than usual, and finally the sharp and totally unforeseen rise in autumn freights, which effectually prevented the impulse to import at a time when such additions to stocks were certain to become dangerous. The month of September proved to be the crucial period, and if freights had not risen the home stocks would undoubtedly have been much larger, and the need of buyers for new goods therefore less intense. As it is, the import during 1896 has expanded to an extent which in ordinary seasons must have led to a general collapse in prices.

### THE ATMOSPHERE OF GLASGOW AND ITS EFFECTS.

SOME years ago an examination was made of the air of different towns, and at that time the condition of matters was stated as:—Manchester, 12' (7124); Newcastle-on-Tyne, 16'7; Glasgow, 18'4 (10589); these figures being the estimated amount of chlorides, while in the brackets are given the amount of acidity (calculated as  $\text{SO}_3$  in grains per gallon of rain). Ammonia salts are a product of the decomposition of animal matter, and their estimation gave, taking Valentia in Ireland as standard purity of 1—Liverpool, 29'89; Manchester, 35'94; Glasgow, 50'55. Albuminoid ammonia, determined by the analysis of the free organic matter in the air, gave—Valentia, 1; Liverpool, 4'67; Manchester, 7'38; Glasgow, 8'82. Nitric and sulphuric acids, the product of the oxidation of organic matter, and the oxidation of a sulphur base, gave respectively:—Nitric acid—Valentia, 1; Liverpool, 1'57; Manchester, 2'79; Glasgow, 6'72. Sulphuric acid—Valentia, 100; Liverpool, 1,450'2; Manchester, 1,641'9; Glasgow, 2,571'; showing, on the whole, that if Glasgow aspires to the rank of the Second City, she may also aspire to the distinction of breathing the most offensive air. We have already mentioned that the air contains many substances, for the most part invisible, divided broadly into gases, dust particles and aqueous vapour, this last varying in quantity with the temperature. One cubic foot of air at 100 deg. Fahr. holds in suspension 20 grains of water, while at the lower temperature of freezing the same capacity of air can sustain only 2 grains. It is well, now, to note the important part that dust plays in this atmospheric economy of nature, a part, in fact, whose importance can hardly be over-estimated.

## ORNAMENTAL TILES FOR WALLS & FLOORS.

Mr. Aitken was the first, we believe, to point out that the aqueous vapour in the air requires a free surface on which to condense, and the minute dust particles, which are always more or less present, afford that surface. A course of observation was instituted at the observatory on Ben Nevis with the particular intention of determining so far as possible the amount and relativity of those dust particles. The eighty observations daily were reduced to a mean of ten, and the general deduction appeared, winds are aqueous or aerial—i.e. "wet" or "dusty." Scotch mist contains very little dust, while fog and haze, or any obscuring mist, contain always a large quantity. Our position, then, is, knowing already that the air contains various acids in suspension, and knowing also that the more dust is present the more is there condensation, the acids in the air are converted into corrosive and destructive solutions, and a process of incipient deterioration is inaugurated. Rain is undoubtedly the chief factor in the gradual destruction and defacement of public decorations, and, as by imperfect combustion of coal and mechanical processes, dust is discharged into the atmosphere, and other inorganic substances are given off, the dust particles assist the condensation of these aerial solutions, and the acids are all in turn projected upon the city. Rain is "air washings," and as the atmosphere mechanically acquires the exhalations of the surface beneath, by determining the constituents of the rain we learn what is in the air, and know from them the particular process going on beneath in our midst.

Having gone so far, we may now be permitted to dismiss all further considerations of purely physical interest, and examine the action of this highly offensive air upon the decorations of the city. In the year 1874 the Municipal Chambers in Ingram Street were opened for the conduct of public business. At that time the carvings and other external sculptural decorations were sharp and crisp from the chisel of the mason. This building has thus been exposed to the influence of a period of twenty-one years' corrosion and erosion, the result being that to-day its appearance is in the highest degree disreputable. Its carvings are defaced, the plane surface is denuded and torn up, the general *tout ensemble* being an effect of the most extreme dilapidation. Many of our public buildings show the same progress towards deterioration, though in varying degrees. It is probably not too much to say that the venerable cathedral may have suffered more within the last century than in all the previous period of its existence. However, there is this much to be said—old buildings have a better chance of survival than modern

ones, since stone which has been exposed to a pure atmosphere for a long period invariably protects its surface by a thin patina of silica, which is an effluent of the inner pores of the stones when fresh from the quarry. The carbonic acid of the air assists the formation of this insoluble silica: it follows, that to improve an old building by scrubbing or chiselling off the old surface is but to completely open the way for a new and first inroad of strongly corrosive substances, from which, in point of fact, it was previously protected. Stone is a combination of silicates. In chemical parlance a silicate is, a "salt," and a "salt" is the resultant of the union of an acid with a "base." In stone the base is alumina, potash, soda, lime, &c., varying in quantity and properties with different kinds of stone, while the "acid" is "silicic acid." The *modus operandi* of the destructive process may be put shortly—the sulphuric and other acids act upon the silicated compound, they unite with the "base" and leave the silicic acid free; the rains gradually remove it, but the salts left in its place are soluble and the result is the stone is first dissolved, its form destroyed and a fresh surface left for continued solution. Consequently old buildings, as we have said, whose surface is not a silicate, but a film of pure "silica," which is most insoluble, are comparatively safe, while the unformed modern stone is built but to decay. Much, of course, depends upon the nature of the stone and the method in which it is built. A due regard for its geological axis will assist in its preservation. It is probably not too much to say that any stone almost is liable to deterioration in such an atmosphere. Cleopatra's Needle on the Thames Embankment has part of the inscription obliterated. The side facing Charing Cross station has almost entirely disappeared. The names of Thothmes III. and Rameses II. have almost vanished. This is in London. The atmosphere of Glasgow is quite as corrosive. This condition of the atmosphere undoubtedly calls for very immediate attention. The pollution of the Clyde has attracted much consideration, and various means have been proposed for its purification, but the fact has probably been lost sight of that the air above is a source of danger and nuisance infinitely more formidable than the Clyde. No sculpture is safe in Glasgow. Marble cannot exist in the open air, as, apart from the question of dirt, soot and olefiant smut, the free carbonic acid of the atmosphere would exert too solvent an influence on the calcium carbonate of which it is mainly composed. It is chiefly on modern buildings that the strongest corrosion is apparent. While the tooth of time has gently nibbled the angles of the old houses it has in many

## The Architect & Contract Reporter.

ESTABLISHED MORE THAN A QUARTER OF A CENTURY.

On New Year's Day, 1897, we commenced the Publication of a series of beautiful illustrations of each of

## THE CATHEDRALS & ABBEYS OF ENGLAND,

Suitable for Framing or Portfolio. The size of the Plates is 18½ inches by 13½ inches. Numerous Views (Exterior and Interior) and very interesting Details will also be given. These illustrations will be given in addition to the usual Architectural Plates. On receipt of a Postal Order or Cheque for 19s. the Paper will be forwarded each week during 1897.

SEE ORDER FORM, PAGE 1, "CONTRACT REPORTER."

MEM.—If the Plates are found to be creased, they can be made suitable for framing or Portfolio by passing a damp sponge across the creases, and afterwards, when ironed with a warm iron, the marks will disappear.

BACK NUMBERS MAY BE OBTAINED.

P. A. Gilbert Wood, Publisher, 175 Strand, London.

cases obliterated the ornaments on buildings comparatively modern.

One point of particular interest to visitors in a strange city is undoubtedly its statuary. Apart from the historical interest that more or less attaches to such decorations, there is the idea of locality as a rule invariably associated with it. In the mind of a citizen of Glasgow, for example, the Cross is inseparably coupled with the idea of King William. George Square cannot be thought of without its statues, and it will often be found that the most permanent memory of a town is the nature and location of its monuments. So it must occur to visitors to Glasgow; and while the city is fairly well set forth in this direction of statuary, probably in no other town in the kingdom are the monuments in such a dirty and disreputable condition. In a pure air the one intrinsic quality of bronze is the exquisite patina which develops upon the surface, the colour varying with the component proportions of the metallic alloy. This chromatic quality of founding is an art which the Japanese have carried to a very high degree of excellence. Their Shibuichi, a grey bronze formed of copper and silver, gives an exquisite series of colour tones in yellow grey; the Shakudo, a copper and gold alloy, when treated in certain acid baths, produces a patina ranging from violet to blue-black. Bronzes containing lead, tin, antimony, produce superb qualities of colour, but probably their best quality in metal is obtained from the "red copper," pure copper shining through a thin film of the sub-oxide. This colour can very often be seen (in a slight degree, certainly, but it is visible) on the steam pipes of locomotives which have been several journeys without being polished. The copper under the influence of heat, atmospheric friction and oxidation has taken on the thin sub-oxide film, an excellent ruby colour. The patina on the statuary of Glasgow is a mixture, not of oxides, but a compound of sulphides, soot and dirt. The skin of the metal is degraded, corroded, and to the view highly obnoxious. The rain has rained upon it, and the fowls of the air have perched upon it. The resultant, derived from a combination of free acids—hydric sulphide, soot and guano—is an exhibition lugubrious and despairing, and to the artistic mind certainly discouraging.

While the purification of the air is not within the immediate power of the authorities, there is really nothing to prevent the public statues from being renovated and restored to a condition of almost pristine quality. The process is a matter of comparative ease, very little being necessary but care and periodical attention. We note day by day workmen engaged examining

the electric-light "manholes." A large number of men are continually employed in a laudable manner keeping the streets clean, and it is in the highest degree desirable that a small auxiliary service should be added to the main body for the purpose of giving periodical care and attention to the monuments. Compare the bas-reliefs on the statue of the "Duke" before the Royal Exchange with the duke himself above. The relievo decoration has developed an agreeable quality of colour in parts, the result of oxidation and friction, as the surface is constantly being fingered by juvenile members of the community, who are more or less interested in the artillery depicted there. It may be noted that bronze exposed to the air, and which is lightly rubbed with the hand, invariably acquires a patina. Of course if the metal is polished the patina is destroyed. In Berlin the same general fact attracted the attention of the authorities. The parts of statuary always fingered took on a colour quality; and they hastened to institute experiments extending over a period of several years. Four statues were selected and placed under observation. One was rubbed all over with oil every day, surplus being removed with a soft cloth. The second statue was washed with water daily. The third was also washed similarly, but polished with oil twice a year. The fourth was left *in statu quo*. On the completion of the experiment—extending, as we have said, over a period of years—the position of matters was thus:—Number one had acquired a splendid colour, number two was clean but dead black, the third was passable, and the fourth was a little better than our own, which, of course, is not saying much for it. There is nothing to prevent the bronzes of Glasgow being treated in similar fashion, not experimentally by any means, but as a matter of law. The figures should all be thoroughly cleansed, then coated with a mixture of oleo-palmitic acid, put on very thickly, and allowed to remain for several days. This paste should then be removed by washing off with a mixture of oleic acid and olive oil, and finished with a polish of olive oil. A periodical visit once a week, with a polish of olive oil, would in a very short time bring out all the intrinsic qualities of the bronze. The function of the oil mixture, in the first place, would be the combination with the oxysulphides on the surface, which would be better removed by that method, so far, at least, as regards the ultimate effect, than by mere washing. In a year's time the bronzes would have acquired an increased artistic value—would be works of art, instead of, as they are, monuments of the antagonism between beauty and commercialism, and an example of the destructive and ob-

# KETTON FREESTONE.

THIS STONE HAS NO EQUAL FOR BUILDING AND MONUMENTAL PURPOSES, AND BLOCKS OF ANY SIZE CAN NOW BE SUPPLIED. SAMPLES AND FURTHER PARTICULARS WILL BE SUPPLIED ON APPLICATION TO

**T. C. MOLESWORTH & CO., KETTON, RUTLAND.**

Extract from a Paper on Masonry read before the Architectural Association at 9 Conduit Street, Regent Street, London, on March 6, 1896, by Mr. HERVEY FLINT, Teacher of Masonry to the Worshipful Company of Carpenters and the Battersea Polytechnic.

"Ketton Stone is one of the best weather stones we have, but it is one that is rather neglected by the Architect. The oolite formation of this stone is very perceptible. We have examples of it at St. Dunstan's Church, Fleet Street, St. Pancras Station, and I was much impressed recently on a visit to the Jews' Cemetery at Willesden by a large balustrade full of good detail, round Baron Rothschild's enclosure; it has been standing some twenty-five years and is in a perfect condition, the carving and arrises are as sharp as when executed and I would strongly commend this stone, as it combines the essentials of durability with a nice warm cream colour."

SHENLEY HILL SILVER AND FILTER SAND PITS.

noxious nature of the atmosphere of Glasgow. The statue of King William at the Cross would take on an excellent colour; the more so as His Majesty is not in this case even a "copper captain," but is made of humble pewter. There would not be the full deep quality of bronze, but a colour which, though totally different, would still be good. It is matter of regret also that one of Glasgow's treasures, and possibly the least appreciated, should be so far left to itself and forgotten as it is. We refer to the "Tiger" in the "Park," an exquisite work of art, and about the only one in the city not an absolute simulacrum of somebody whom nobody knows and everybody has forgotten. This statue is worthy of particular attention. It is a possession which any community might be proud of, and it betrays an inconsistency almost inconceivable that any municipality who aspire to be known as protectors of the arts should leave this work to corrosion and decay.

Since the air of Glasgow exerts so destructive an influence on stone and bronze, it would be too much to suppose that pictorial art should escape. While undoubtedly all this is good for the "painters" it is very bad for shopkeepers; and the expense entailed on renovating the external decoration of warehouses, signs, &c., is something enormous. White fronts invariably become grey, and cheap gildings tarnish. Of the decorative processes mentioned on a former occasion, mosaic is the only imperishable pigment (with certain exceptions), and resists absolutely all atmospheric deleterious influence. Water glass, encaustic painting and fresco are to an extent obscured by dirt, the free carbon and mechanical impurities of a manufacturing city. Though these to an extent are filtered from the air by suitable means, still it is never with any system entirely free from such impurities. Again, there are the organic molecules which are respired and exhaled from the body, particles which when in excess give that peculiar foetid odour always perceived in over-crowded rooms; all these are ultimately deposited to further decompose. Mosaic also becomes dirty, but it can be cleaned mechanically and readily. This cannot be done with the others, unless with great care, and by experts. When this is the condition of matters in processes that are usually assumed to be imperishable, what can be said for oil painting "that fades with the passing air"? Oil painting depends for its permanency in a manufacturing city to a great extent upon the manner in which it is painted. The incomparable little Van Eyck in the possession of the Corporation retains almost its original purity, while paintings of comparatively recent execution have necessitated restoration and other

improvement. Certain schools, certain palettes bear within themselves the germs of decay, some from the combination of "incompatible" chemical substances, others from the use of fugitive pigments, others from a degraded method of execution, and some from the maladroit use of "medium" and "varnishes." Mr. C. Napier Hemy, in a letter to the secretary of the Society of Arts, 1892, said:—"What artists want is some thing nice to paint with, so one takes Robertson's (pomatum) medium, and his picture goes yellow and dirty, and looks as if it had been buttered; another takes copal varnish, and it cracks; another amber varnish, and the work gets horny or blooms; another turpentine, and it goes dull; and so on." It is hardly possible to treat of the effect of the atmosphere of Glasgow upon pictorial art without at the same time speaking of the method of the artist. When the years have passed and individuality has gone, many modern pictures will be recognised by their stages of decay. The trowel and palette-knife method will have, if unvarnished, the colours degraded, the lead whites blackened into sulphides. Flake whites in combination, whole or part, with orpiment, Indian yellow, gamboge, carmine, orange orpiment, sap green, will lose their verve and become lowered in tone. Pictures thinly painted and lightly varnished in Glasgow air have such whites as cremnitz and flake blackened. Chrome yellow, Naples yellow, emerald green, Prussian blue, Antwerp blue, orange chrome become changed by the action of hydric sulphide and aqueous vapour. The Van Eyck (labelled Van Der Goes, if we mistake not) owes its marvellous condition to the manner in which it was executed. The colours themselves are anything but permanent; the lakes on the banner and dress are fugitive in air, and the picture retains its initial quality only because each molecule of pigment has been surrounded by a suitable medium and is isolated from its neighbours. The medium has also been impervious to atmospheric influence and to light. In ordinary circumstances, then, this picture would have become obliterated long ago if it had not been painted in a suitable manner and with a very special medium. Consequently while with statuary, architecture and the industrial arts the artist is to a great extent in the hands of Providence, as represented by a paternal municipality, the artist in oil paint can by a thorough scientific method render his work very permanent. Pictures, like anything else, are liable to organic decay. They may also suffer from dirt, but organic decay has not overtaken Egyptian paintings executed many thousand years ago, and dirt is removable.

At this point, however, it may be well to note that in the free air of Glasgow pictures would become unrecognisable in a very few years. Not only would the transparent homogeneity of the varnish be destroyed, but the gradual deposition of soot and other impurities would very soon render destruction complete. Pictures, like anything else, can be preserved if special measures be taken for their protection. Works of art which are efficiently conserved in galleries, public and private, do not come within the scope of the full influence of Glasgow air. On the other hand, oil paintings which are executed as mural decorations are to an extent exposed to certain destructive influences, such as the respiratory products of large companies, changes in temperature and ineffectual actinic exposure varying with their situation, and though the air may be better from the mechanical filtering which it undergoes, as in the Municipal Buildings, still impurities are not entirely absent. The air certainly is cleaner, but it is not much purer. Even the best paintings must inevitably reach a limit of existence. The Vatican is wisely anticipating that evil hour for the value of their property, and such paintings as they possess are being gradually translated into mosaic, which will be absolutely imperishable, and thus the works of such masters as Raphael, Michel Angelo and Da Vinci, works which have more or less become deteriorated, will experience a renaissance and continue the delight and admiration of future *cognoscenti* for innumerable generations to come.

The general conclusion we ultimately arrive at may be briefly stated. Though the atmosphere of Glasgow is highly offensive from a sanitarian point of view, and is, in fact, inimical to the preservation of public buildings, statuary and works of art generally (especially where the use of pure pigment is involved), and is further, apart from the destructive influence of many of the impurities contained in it, a declared enemy to cleanliness in person and dress, there can be no ready means of instituting preventive measures for the removal of this unfortunate condition of matters. In the first place, the only procedure possible for the municipality is to inaugurate a process curative and preventative, as far as possible, applied towards the preservation of public property. This intention can best be met by such treatment so we have already indicated as regards the statuary. As for public buildings, their preservation can only be effected by the adoption of some chemical preventative process, such as the external application of a solution of a double silicate of potash and alumina, or some such means.

## PORTLAND CEMENT INDUSTRY IN BELGIUM.

THE most important centre for the production of Portland cement in Belgium is the calcareous district of Tournai. Some of the quarries in this district date back several centuries, when they were principally worked for building stone and for the manufacture of hydraulic lime. The calcareous stone of these quarries, which, according to the United States consul at Brussels, originated the now extensive and important industry of cement manufacture, extends for many miles in length in apparently inexhaustible quantity. Ordinary lime, best hydraulic lime, slow-setting (Portland) cement and quick-setting (Roman) are especially products of these immense quarries. Consul Roosevelt says that natural Portland cement is obtained from calcareous stone which is carefully analysed and dosed, treated in coke-heated kilns, and after burning finely pulverised. Analyses of the calcareous stone found at Tournai shows the following result:—Silicic acid, 15.75 per cent.; oxide of iron, 1; alumina, 3.95; lime, 43.1; magnesia, .49; sulphuric acid, .5; loss in firing, 35.21 per cent. Before burning the stone presents a fine close grain, and is of a peculiar pasty appearance. Prior to calcination the stone is carefully analysed to ascertain the exact quantity of lime as well as other chemical properties it may contain. The stone loses about one-third of its weight during the process of burning, which also changes it to a brown tinge. When withdrawn from the kiln the cement is placed under sheds to thoroughly cool before being ground. After grinding, and before being packed into barrels, it is put into pits and left undisturbed for two months. Natural Portland cement was first produced in Belgium in 1882, and the establishments now engaged in the enterprise have formed a syndicate under the name of "Mutualité Commerciale des Ciments Belges," with headquarters at Tournai. The company sells about 1,200,000 barrels of cement annually. The syndicate has adopted as a trade mark the figure of a hammer. Any firm, however, of the syndicate having a trade mark is privileged to use it. For instance, those firms having the well-known "rhinoceros," "tröwel," "sword," &c., use them in conjunction with the syndicate trade mark. Independently of the trade marks of the manufacturers, important buyers of the Mutualité who have labels enjoying a certain reputation, are permitted to affix them on the barrels. It is stated that the principal object of this arrangement by the Belgian manufacturers is to warn and protect persons who purchase Roman cement for export

without mark or label, and unknown and unauthorised by the manufacturers have Portland cement labels affixed to the barrels at the port of shipment. Roman cement is also made in the Tournai district. It is much cheaper than Portland cement, the selling price being about fifty per cent. less than the Portland. It is much employed in Belgium, replacing advantageously a good hydraulic lime. Manufacturers, however, will not guarantee it, as it is made of refuse stone not suitable for the manufacture of Portland cement. It has a natural light yellow colour. Cinders are very often added, changing it to a greyish colour resembling Portland cement, and also including its resistance in a slight degree. This is the product which is purchased by unscrupulous exporters and sold by them marked as Portland cement. This fact is significant, and should attract the attention of builders, to avoid disasters such as the unexpected collapse of buildings where first-class cement has been supposed to have been employed. Artificial Portland cement was first manufactured in 1872 by a Belgian firm—Messrs. Duffossez & Henry. There are now several important works engaged in its manufacture. Artificial Portland cement is the result of burning a thorough admixture of clay and carbonate of lime in constant proportions, and when dry reducing to finest powder. Several cements are manufactured by burning natural argillaceous limestone containing varying proportions of clay and carbonate of lime. Some manufacturers rectify the composition of these cements after burning by adding as required, limestone, slag, &c. Cements are thus produced, resembling in chemical constitution Portland cement, but which do not possess its properties, on account of the constituent elements not having been forced into combination by calcination and semi-fusion of the mass. These cements are sold under the name of artificial Portland cements, though in reality they are mixed cements, composed of limestone or slag, possessing none of the qualities or properties belonging to real Portland cement. Artificial Portland cement having an invariable chemical composition must necessarily present a constant character and behaviour, and the small differences shown by the assays arise generally from more or less perfection in the burning and grinding, but also exhibit radical changes in their physical and chemical constitution on account of the varying proportion of their component parts. Cement may be submitted to a large number of tests for the purpose of ascertaining its qualities. These tests relate to (1) regularity of composition; (2) fineness of grain; (3) gravimetric weight; (4) specific gravity; (5) time of setting;

(6) resistance to tensile, compressive or shearing strains and cohesive strength, either when pure or mixed with sand; (7) uniformity of volume or expansion; (8) resistance to frictional wear; (9) expansion; (10) impermeability, &c. To be considered of good quality the cement must give a satisfactory result to the group of tests to which it is submitted. Thus, if properly proportioned, it should, for a given fineness of grain, have a maximum of weight and specific gravity, fulfil the required conditions of setting, and show the minimum of resistance to strain required within a given time.

### PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

### APPLICATIONS FOR PATENTS.

29232. Joseph Thomas Andrews and George Edward Montagnon, for "Improvements in stair treads, landings and coverings of subways, sewer outlets and the like."

29247. William Frederick Crowther, for "Improved cleaning chamber in metal street gully and grate."

29264. Henry James Stewart Cross, for "An improved sink trap."

29347. Frank Gutteridge, for "Improvements in brick-making machines."

29425. John Smith, for "Improved machinery or apparatus for cleaning sewage and other matter off gratings."

29429. Benjamin Joseph Barnard Mills, for "Improvements in brick kilns." (Charles E. Coats and Llewellyn Hancock, United States.)

29563. William John Calloway, for "Improved means for securely holding chimney-pots in position."

29793. Edmund Ashby, Robert Ashby and Samuel Richard Short Batley, for "A new or improved construction of drying floors for bricks and the like goods."

## TRADE NOTES.

THE Denton Holme Board Schools, Carlisle, are being warmed and ventilated by means of Shorland's patent Manchester stoves, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

MESSRS. C. E. LEOPOLD & Co. have opened their Japanese paperhangings warehouse at 24 Cecil Court, Charing Cross Road, London.

A HANDSOME oak font cover of Perpendicular design was at Christmas time presented to Brampton Abbots Church, near Ross. It is pyramidal in form and octagonal on plan, the lower part being arranged to raise and lower by an ingenious system of pulleys and weights, the upper part being fixed to a bracket springing from an adjacent beam. It bears the following inscription, "To the Glory of God and in memory of George Gilbert Hulme." The work has been executed by Messrs. Jones & Willis, of Birmingham and London.

A GAS explosion has occurred in the Public Buildings at Penzance, and considerable damage done to the north-east corner of the premises. The glass, ceilings, plastered walls and doors of the geological museum, the staircase, ante-rooms and corridors were shattered and broken. Fortunately there was no personal injury.

## VARIETIES.

ANOTHER interesting old mansion, Dunipace House, situated between Denny and Larbert, has succumbed to the devouring element. Dunipace House was a building of three flats, with attics, and containing about thirty-five apartments. The most serious loss in connection with the conflagration is the contents of the museum, the gathering of a lifetime, and which cannot be replaced. The loss is estimated at about 15,000*l.*

WHILE workmen employed in the Central London Railway, at Wood Lane, Shepherd's Bush, were pulling down some houses, one of the walls collapsed, injuring five men.

LADY PENRHYN and Miss Glynne are about to place a window in Hawarden Church, in memory of their sister Nora. It will replace what is known as the old Vine Window.

A TENDER for 19,209*l.* has been accepted for the rebuilding of the Royal Cambridge Music Hall.

ON Saturday morning the greater portion of the Bishop Auckland Post Office was burned down. The damage done is considerable.

A BRASS tablet is to be placed in Bovey Tracey parish church, Devonshire, to the memory of the late Bishop Knight Bruce, who was vicar of the parish.

AN Arts and Crafts Exhibition is to be held at Lancaster in commemoration of the Queen's lengthy reign.

ABOUT four o'clock on Saturday morning last fire was discovered to have broken out in the gallery of the recently redecorated Royal Court Theatre, Liverpool. The flames spread rapidly, and for a time it was feared that the building would be totally destroyed. Fortunately, by the exertions of the fire brigade, the fire was confined to the gallery and the roof, where, however, serious damage has been done. The under portions of the house have also been considerably damaged by water, but owing to the energy and pertinacity of the lessee, Mr. Robt. Arthur, the theatre was ready for reopening last night. A great number of workmen were engaged night and day replacing the roof, and this part of the structure was practically completed on Tuesday, proof against all kinds of weather. The fire, as before mentioned, was confined to the gallery, and the beams supporting the seats and some of the seats themselves were partially burned. These beams remain in position, but alongside are placed new supports of equal strength to the others when they were in their original state, so that the actual

resistance to pressure is much greater than it was previously. The beautifully painted ceiling has been destroyed, but this has been covered by a strong striped canvas, which serves the purpose splendidly, and does not materially detract from the appearance of the interior. Between twenty and thirty braziers have been continually alight in the theatre to obviate the dampness—in fact, the place is now almost as dry as it was before the fire.

A NEW Congregational school-chapel has been opened in the High Park district, Southport.

A NEW church has been consecrated at Cwnpark, in the parish of Ystradfydwg, Rhondda Fawr Valley. It comprises a chancel, nave, south aisle, porch and massive tower over 60 feet in height, and accommodates about 400 worshippers. It has been erected at the cost of Mrs. Llewellyn, of Baglan Hall.

THE Duke of Norfolk a short time ago generously provided Arundel with a splendid water supply. Negotiations between the duke and the local authorities have now resulted in the formulation of a scheme for extending this supply to Littlehampton.

A SCIENCE and art school is to be erected at Newark in commemoration of the sixtieth year of Her Majesty's reign. The Duke and Duchess of Newcastle have offered to give a piece of land. Mrs. Manners, Mrs. Macrae and Miss Gilstrap, three of the beneficiaries under the will of the late Sir William Gilstrap, have each promised a sum of 500*l.* towards the fabric, and the mayor of Newark (Mr. Alderman Pratt) has promised to contribute a further sum of 250*l.*

A SHORT time ago the fire brigade sub-committee of the Leeds Corporation visited half a dozen factories, with the view of considering what improvements could be carried out so as to prevent loss of life in the event of fire. At a meeting of the committee since held, under the presidency of Mr. Green Hirst, drawings were submitted for suggested alterations in the exits, for staircases, &c., which had been prepared by the city engineer's department, and these were unanimously approved of. The owners of the factories in question will have the drawings laid before them as suggestions from the Corporation, and as the committee do not wish to put the owners to unnecessary expense, they will be prepared to consider suggestions from them before compelling them to carry out the alterations.

As a result of the agitation on the part of the Wolverhampton carpenters and joiners for an increase in the rate of

wages, the masters have offered an advance of a halfpenny per hour, which the workers have accepted.

A SITE has been secured at Nelson, near the South Park, on which the Roman Catholics intend to build a new school, at a cost of 2,000*l.*

ON Wednesday morning the members of the Leigh (Lancs) branch of the United Operative Plumbers' Association came out on strike for an increase in wages of from 8*d.* to 9*d.* per hour, the standard rate in Liverpool, Manchester and other towns. Some firms have consented to the advance, but others decline to recognise the union, and have given no reply to the men's request. The trade is fairly brisk at present.

EARLY on Wednesday morning the shipbuilding yard of Messrs. William Hamilton & Co., Port Glasgow, was partly destroyed by fire. The joiners' shop and sawmill, two buildings about 330 feet long running parallel, were destroyed. The Port Glasgow and Greenock brigades were in attendance, but their efforts were unavailing. The damage is estimated at 30,000*l.*

A SHOCKING accident occurred on Wednesday morning at the Eiffel Tower which is in course of construction at New Brighton, near Liverpool, two men being killed and a third seriously injured. The deceased men were in the employment of Mr. Handyside, of Derby, who is the contractor for the ironwork of the tower. They were working on a scaffold 35 feet from the ground, and were engaged in fixing one of the huge iron girders, when the hook and the crane used for lifting the iron gave way. The ironwork which was swinging from the crane fell, and in its descent it struck the scaffold on which the men were working, entirely demolishing the structure. Two of the men, John Richards and Alexander Stewart, were instantaneously killed, both having sustained shocking injuries from the falling iron, while a third workman, named John Daly, belonging to Hulme, Manchester, was rendered unconscious, and had to be removed to the Seacombe Hospital. The two men killed belonged to Derby.

THE new Selkirk High School, which has been built and is to be maintained by the governors of the Scott and Oliver Trust as a school for higher or secondary education, was formally opened on the 12th inst. The school contains a commodious entrance-hall, three classrooms, and private rooms for the teachers, is provided with all the necessary appurtenances of playsheds, lavatories, &c., and has ample playgrounds around it.

82 BELVEDERE ROAD, LAMBETH, LONDON, S.E.

THE next ordinary meeting of the Institution of Civil Engineers will take place on Tuesday, January 19, at 8 P.M., when the paper on "Superheated-steam Engine Trials," by Professor W. Ripper, M.Inst.C.E., will be further discussed. A students' visit will be made on Thursday, January 21, at 2 P.M., to the engine-works of Messrs. James Simpson & Co.

DURING the recent royal visit to Trentham, the Princess of Wales, accompanied by the Duchess of Sutherland and several members of the house party, drove over to inspect Messrs. Minton Hollins' world renowned potteries. The various processes were shown in operation and carefully explained to the Princess, who manifested the greatest interest and expressed her gratification at what she had witnessed. A beautiful bouquet was presented to H.R.H. by Miss Amy Hollins, granddaughter of one of the principals.

At a meeting of the Loughborough Town Council, held on January 4, a letter was read from Mr. Joseph Griggs, J.P., D.L., offering to erect and present to the town public baths at a cost of 3,000*l.*, to commemorate the completion of the sixty years of Her Majesty's reign, upon a site to be provided by the Corporation. The borough of Loughborough has previously benefited by the generosity of Mr. Griggs, who held the office of Mayor for the first two years after the incorporation, and the office of High Sheriff of the county during 1895. Mr. George H. Barrowcliff, architect, of Loughborough, has been entrusted with the work.

THE Victoria Stone Company have had prepared for their very numerous customers a handsome diary-blotter, which is not only made of excellent paper, but has also novelty. The applications of the materials are so numerous, the Victoria stone may claim to have general utility, and we hope many orders for it will be registered on the memoranda slips.

THE partnership between Mr. S. Walker and Mr. Ernest Rüntz has been dissolved. Mr. Walker has taken his son, Mr. W. S. Walker, into partnership, the firm being henceforth "S. Walker & Son." Mr. Rüntz will confine his attention to architecture.

MR. ALDERMAN RYMER, of Croydon, gave as his reason for opposing the proposed increase of the lamentably inadequate resources of the Fire Brigade by the erection of a new central station and the purchase of six horses, four of which would be available for the purposes of the corporation, on the grounds that he thought that the pouring of water on burning buildings

was a failure, as he believed that before long the science of chemistry would be brought to bear on the subject and that the cumbrous appliances now in use would be done away with.

MESSRS. OLDACRES & CO., electrographers, lithographers and law stationers, have removed to 52 Chancery Lane, Holborn, W.C.

### ELECTRIC NOTES.

THE electric-lighting committee of the Derby Corporation have just issued a report respecting the undertaking. They say that there has been a satisfactory and steady increase in the consumption of electricity, and in order to meet the demand which they anticipate will be made upon their resources during the next three years, they are about to ask the Town Council to grant a further sum of 20,000*l.* for extra plant and machinery.

CONSIDERABLE improvements have been carried out during the last twelve months in Clonfert Cathedral, co. Galway, under the supervision of the architect, Mr. J. F. Fuller, F.S.A. The chancel has received special attention. This portion of the building is over a thousand years old. The ancient sacristy, roofed with Danish wattles, has been repaired without altering the archaic character of the structure.

THE Canterbury Town Council have resolved to apply to the Local Government Board for sanction to expend a sum of 23,000*l.* in laying down municipal electrical works in the city.

MR. SYDNEY MORSE and Mr. Alexander Siemens have been elected respectively the chairman and second deputy chairman of the Electrical and Allied Trades Section of the London Chamber of Commerce.

PROFESSOR KENNEDY'S report on the electric lighting of Stirling was submitted to a meeting of the Stirling Police Commissioners on Monday night. It recommended the adoption of the continuous current three-wire system with 200 volt lamps, the estimated cost being 16,000*l.* for the compulsory area and 20,000*l.* for an extended area, including the residential part of the town. The lighting committee recommended the adoption of the report and a remit to the committee to carry out the work to the whole extent therein indicated. Provost Kinross suggested that the matter should be continued for a week for further consideration of the report, and this was agreed to.

# THE NEW EXPANDED METAL

*Meshes from  $\frac{3}{8}$ th in. to 6 in. wide. Strands from 24 B.W.G. to  $\frac{3}{16}$ th in. thickness of steel.*

**FOR BUILDING CONSTRUCTION**, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

**FOR SOLID PLASTER PARTITIONS**, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

**FOR FIREPROOF LATHING**, for attaching to wooden joists and studs; for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

**FOR CONCRETE FLOORS WITH EXPANDED METAL**.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

**FOR EXTERIOR WALLS OF BUILDINGS**.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

**FOR FENCING, TREE GUARDS, WINDOW GUARDS**, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

**ORNAMENTAL. STRONG. CHEAP.**

**OTHER USES FOR EXPANDED METAL**.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away. Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

**BRASS, ALUMINIUM**, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

**CATALOGUES AND PRICE LISTS** can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

Telephone No. 1829.

## DORMER WINDOWS.

ON Tuesday Mr. C. F. Kearley, builder, was summoned before the Lord Mayor, under the London Building Act, 1894, for failing to comply with a notice of irregularity requiring certain omissions to be remedied in the building of premises at No. 60 Cheapside. Mr. Hugh M'Lachlan, the district surveyor, who appeared in support of the complaint, said the builder was willing to do the work required, but the architect and owner declined. The question was whether certain dormer windows on the roof of the premises, which were constructed of wood covered with lead, were combustible within the meaning of the Act, because, if so, the party walls must be made 12 inches higher and wider on each side of them to comply with the Act, and that was what the notice served on the defendant required to be done. Mr. Daldy, solicitor, who appeared for the owner of the premises, contended that the dormers, being covered with lead, were not combustible, although the lead might be melted by fire. There was only a small proportion of wood, and his contention was that lead and glass were not combustible. The chief clerk (Mr. Douglas) said the list of fire-resisting materials enumerated in the Act did not include lead. The Lord Mayor, observing that it was a pity the Act was not more explicit, directed the notice to be complied with within a month, and granted 13s. costs.

## ACETYLENE GAS.\*

At the present time the introduction of acetylene gas, made by acting upon calcic carbide with water, and which is at once the most easily made and the most brilliant of all known gases, promises a complete revolution in domestic lighting where coal-gas is not to be obtained, but much has yet to be done in educating the public as to the proper way in which to use it, as well as in the character of the calcic carbide from which it is produced and in the forms of apparatus employed to generate the gas.

Acetylene, or as it is sometimes scientifically called, ethine, is a gaseous compound of 24 parts by weight of carbon with

\* From the Cantor Lecture by Professor Vivian B. Lewes, published in the *Journal* of the Society of Arts.

2 of hydrogen, and was first discovered and isolated by Edmund Davy in 1836, but it was not until 1859 that Berthelot's investigations gave the scientific world a clear conception of its interesting character and properties. Since that time it has been frequently prepared in small quantities by tedious and costly processes, and it is only within the last few years that a cheap and simple method has been discovered and has brought its use within the range of commercial possibility.

The fact that carbon and lime could be made to directly act upon each to form calcic carbide was discovered independently by Willson in America and in France by M. Moissan, but there exists abundant proof that Willson was making and experimenting with calcic carbide, and had sent specimens of it to various correspondents some time before Moissan had made any announcement of his discovery, and therefore priority undoubtedly rests with the American discoverer.

Calcic carbide is a dark grey substance having a specific gravity of 2.262, and when pure a pound of it will yield, on decomposition, 5.8 cubic feet of acetylene. Unless, however, it is quite fresh, or means have been taken to carefully protect it from air, the outer surface becomes slightly acted upon by atmospheric moisture, so that in practice the yield would not much exceed 5 cubic feet. The density and hardness of the mass, however, protect it to a great extent from atmospheric action, so that in lumps it does not deteriorate as fast as would be expected, but in the powdered condition it is quickly decomposed.

On the addition of water to the calcic carbide a double decomposition takes place, the oxygen of the water combining with the calcium and once again forming lime, whilst the hydrogen unites with the carbon of the carbide to form acetylene.

At the present moment the future of acetylene as an illuminant is largely dependent upon two factors, the commercial production of calcic carbide of a reasonable degree of purity; and secondly, methods for safely making and burning the gas in such a way as to develop its full illuminating power, whilst doing away with the risk of smoking; and as I first drew attention to the production of the carbide, and from it of the acetylene, on a commercial scale in this country, I feel that the results of the past two years' experience will not be without interest.

In spite of extended experience both here and abroad in the manufacture of calcic carbide, the details given as to its cost and the price at which it can be purchased offer the most enter-

W. WATSON &amp; SONS, 313 HIGH HOLBORN, LONDON.

ESTABLISHED 1837.

OPTICIANS TO HER MAJESTY'S GOVERNMENT.  
MANUFACTURERS OF THE HIGHEST GRADE OF INSTRUMENTS ONLY.

## WATSONS' NEW WHEEL PEN.

(BROADBENT'S PATENT)

The most satisfactory Dotting Pen made. It never sticks. The ink always flows freely. It is easily used. Complete with three wheels to make various width lines .. 10s. 6d.

New Depth Gauge for Engineers, 4 inches by 1/2 inch wide, in leather case. The slide and one side marked to read by verniers to 100ths of inches and 1/10th of millimetres. The other side marked for use as a rule, in inches and 64ths and millimetres and halves .. 5s. 6d.

Watsons' celebrated 12-in. Boxwood Scales, "The Universal," 16 scales of an inch, 4 on each edge, all reading from the edge .. 1s. 6d., post free, 1s. 8d.

"The Architect's" Scale, flat section, 16 scales, but each reading in its own line .. 1s. 6d., post free, 1s. 8d.

"The Armstrong" oval section, 8 scales, 2 on each edge .. 1s. 6d., post free, 1s. 8d.

Surveyors' Chain Scales, containing any two scales or chains and feet each edge, flat section .. 1s. 6d., post free, 1s. 8d.

Full Illustrated Catalogue of Surveying and Drawing Instruments sent post free on application.

## WATSONS' CASES OF IMPROVED DRAWING INSTRUMENTS.

No. 2388.—8-inch Oak Case, lined with Silk Velvet, containing the following finest quality Electrum Instruments:—6-inch needle pointed Compass with lengthening bar and ink and pencil points, hair dividers, needle pointed pen and pencil bows, two drawing pens, prickler, knife key, ivory protractor and parallel .. 44 12 6

No. 2389.—8-inch Oak Case, similar to above and containing same Instruments, but with proportional Compass added .. 45 15 0

No. 2390.—Morocco Pocket Case, lined with Silk Velvet, containing the following needle point Electrum Instruments:—4 1/2-inch double jointed Compass, with ink and pencil points and lengthening bar, hair dividers, ink and pencil bows, three plain point spring bows, two drawing pens, prickler, ivory protractor and parallel—an exceedingly compact set, suitable for the pocket, of very finest quality .. 45 0 0

IVORY POCKET RULES, ELECTRUM MOUNTED.  
One foot four-fold Pocket Rule .. 5s. 6d.

Two feet, four-fold Pocket Rule .. 18s. 6d. and 21 1s.

Prices of Drawing Instruments are subject to a Discount of Ten per Cent.

taining reading, as whilst the patentee and would-be seller of acetylene generating plant still talk airily of the cost of the carbide being anything from 30s. to 7l. a ton, the price at which one can purchase carbide more nearly approaches 30l. Indeed, in Paris at the present moment there is considerable difficulty in getting it at 40l. a ton, although we are informed that this is merely due to a temporary carbide famine, and that the new sources of supply will soon reduce the selling price even below 16l. a ton, at which it stood before the late rise in price. Be this as it may, the factor which interests us is the price at which carbide can be obtained in England, and the Acetylene Illuminating Company, who hold the Willson patents for the production of carbide, and also the Cowles electric furnace patents, which I believe enable them to control the manufacture of carbide in this country, have fixed their selling price at 28l. per ton, and although there is no doubt that they will give contracts in considerable quantities at a reduction on this price, yet it is with the factor of the selling price to the public and not with the manufacturing price that we have to deal.

In most cases, the possible prices quoted for calcic carbide by inventors who have been carried away by their wishes rather than by hard facts are simply absurd, and far below the price at which the substance can be produced, and it may be of interest if I give the figures for the electric power necessary, which I myself have obtained in practice in the manufacture of calcic carbide.

Having been kindly granted the use of the electric plant erected for the manufacture of calcic carbide at the experimental works of the Acetylene Illuminating Company, a plant capable of working continuously at from 60 to 70 volts at 1,000 to 1,200 amperes, I made a series of experiments in order to determine the best proportions in which to mix the ingredients from which the carbide is manufactured, and to find out the amount made per electric horse-power.

The production of carbide from lime and carbon under the influence of the heat of the electric furnace appears to take place according to the formula—

and in order to obtain this reaction it would be necessary to use 56.1 per cent. of lime mixed with 43.9 per cent. of carbon. In practice, however, it must be remembered that the carbon used will either be finely-powdered coke or charcoal, neither of which are pure carbon, whilst the lime employed will always vary in purity, such variations having, as I shall presently show, a very important bearing upon the purity of the carbide and

acetylene produced from it. Another practical point also presents itself, and that is that unless the mixture is suitably arranged considerable variations in the amperage and consequent loss of efficiency in the furnace will result.

Using a mixture of 60 per cent. of lime and 40 of carbon, a run lasting  $3\frac{1}{2}$  hours yields about 112 lbs. of fused ingot, and of this 81 per cent. was practically pure carbide, the remainder being a crust of lower value.

The mixed carbides yielded 5 cubic feet of gas per pound, and contained 89.2 per cent. of true carbide; hence the yield may be taken as being 32 lbs. per hour of the commercial carbide.

The current used was 60 volts at 1,000 amperes, or 89 E.H.F., which gives as the make about 0.4 lbs. per E.H.P., per hour, and the result of continued experiments show that 0.3 to 0.4 lbs. per E.H.P. per hour is the average yield.

The cost of the electrical horse-power will, of course, vary with the source from which it is obtained, and the use of steam power for generating the electricity appears too costly to be entertained, unless the present electrical lighting stations could see that it was to their advantage to level up their load by manufacturing the carbide under license when not employed in supplying current directly for illuminating purposes. The Acetylene Company have, however, secured considerable water-power at the Falls of Foyers, and a full installation of carbide plant is at work there, whilst still further water-power has been secured in a convenient position, and additional works will be erected; but it will always be the demand and not the cost of the carbide which will govern the price.

The following yields of acetylene from various samples of commercial carbide that I have analysed give an idea of the variations to be found in the article:—

Swiss carbide per lb.—I. yielded 4.38 cubic feet of acetylene, II. yielded 4.60 feet and III. yielded 4.56 feet.

German carbide per lb.—I. yielded 3.82 cubic feet of acetylene, II. yielded 3.46 feet, III. yielded 3.24 feet, IV. yielded 2.43 feet.

English carbide per lb.—I. yielded 5.24 cubic feet of acetylene, II. yielded 4.84 feet, III. yielded 5.04, IV. yielded 5.52 feet, V. yielded 4.84 feet, VI. yielded 5.32 feet.

It is evident, therefore, that there are wide differences in the commercial article, but with reasonable care in the manufacture the carbide should yield an average of 5 cubic feet of acetylene per pound.

(To be concluded.)

# ARMOURED DOORS

## A STEEL SHEATHED WOODEN DOOR WHICH IS FIREPROOF.

ACCEPTED & RECOMMENDED by ALL INSURANCE CO.'S.

WILL NOT BUCKLE  
OR WARP LIKE  
THE ORDINARY IRON  
DOORS.

CAN BE FITTED  
WITH AUTOMATIC  
SELF-CLOSING  
ATTACHMENT.

HAS STOOD THE MOST SEVERE TESTS IN THIS COUNTRY.  
FIRE AT THE WORKS OF THE ANAGLYPTA CO., DARWEN, LANCASHIRE.

The door we fitted in these works, although subjected to a heat intense enough to melt brass taps and fittings near it, withstood the heat perfectly, and can now be inspected at our works in Manchester, fit for duty. The metal sheets have expanded without becoming detached, whilst the wood is simply charred to a depth of about  $\frac{1}{8}$  of an inch.

## "EXPANDED METAL" IN FIREPROOF FLOORS.

It was known for some time that the introduction of Golding's expanded metal in concrete, cement or other material not only increased the strength of that material, but also its fire-resisting qualities. Hence partitions, ceilings, floors and walls are improved without any extraordinary outlay. In order to demonstrate again how much endurance is possessed by floors of which the expanded metal forms an element, some remarkable tests were applied in the presence of architects, engineers and other experts, on Monday last, at Mr. Lockwood's yard in Sackville Street, Manchester.

The first exhibit was a continuous flat concrete floor, of an area of 48 square feet, carried upon channel irons (6 inches by 3 inches) and concrete arches arranged 4 feet apart, with a rise of 13 inches, according to the "Golding system." The transverse flooring joists or girders (16 inches by 6 inches) were fixed 12 feet apart from centre to centre. Expanded metal of 3-inch mesh had been embedded in the concrete flooring slab, which had a total thickness of 3 inches throughout. The concrete was composed of one part Portland cement to three parts of granite chippings, sieved to  $\frac{1}{4}$  inch, and the work had been allowed one month in which to thoroughly set or harden. The total average weight of the flooring with its ribs was 35 lbs. per foot super.

The second exhibit comprised an arched concrete floor (on the Monier system) in which expanded metal had been embedded in lieu of Monier rods; it was 3 inches thick at the crown and 4 inches thick at the springing or haunches. In other respects, *i.e.* span, area covered, ingredients of concrete, &c., the structure was similar to No. 1.

The comparative strengths of these two structures were then tested by the application of uniformly distributed loads in the form of lead ingots, weighing 100 lbs. each. The result was

that, while the arched (Monier) floor collapsed under a live load equivalent to 12 cwts. per square foot, the Golding floor (Exhibit 1) was still unbroken at the close of the experiments, that is, under a live load of about 17 cwts. to the square foot.

The experiments were undertaken in connection with the flooring contracts for the New Brighton Tower, which is being erected under the supervision of Sir Benjamin Baker, past president of the Institute of Civil Engineers.

The structures were erected by Mr. Homer Lockwood, of Manchester, the tests being conducted in the presence of a representative of Messrs. Maxwell & Tuke, of the same city, who are the architects of the tower.

The employment of expanded metal in the test exhibits gave every satisfaction, and in the second case, where it had been substituted for Monier rods, the advantage of strength was nearly 10 per cent.

In both instances there was some lateral displacement of the joists through the thrusting actions of the loaded arches, which to some extent impaired the ultimate efficiency of the floors. In the Golding structure the deflection of the floor attained  $4\frac{1}{2}$  inches without rupturing.

## THE SURVEYORS' INSTITUTE.

MR. HOWARD MARTIN read a paper "On the Future Development of the Surveyors' Institute" at the temporary premises of the Institute, Savoy Street, Strand, on Tuesday evening. The chair was taken by the president, Mr. Daniel Watney. Mr. Martin, after referring to the history of the Institute since its formation in 1868, and the progress it had made, said its members were now spread over the whole country. With regard to another institution which he named, he said there was little done for its country members; but as to the country members of the Surveyors' Institute, they were charged somewhat lower fees, and had all the advantages of the Institute in London. While this was so, however, they laboured under a disadvantage in reference to the obtaining of information, their means being limited to their own circle of influence. He proposed, first, that provincial libraries should be established; and secondly, that meetings should be held, taking the provincial centres in rotation. By these means the provincials would be kept posted up, and an increased interest in the Institute promoted. A vote of thanks to the lecturer was proposed and carried, and the discussion was adjourned.

## PETERBOROUGH CATHEDRAL.

THE following preliminary specification\* has been written at the request of the Society of Antiquaries, in order to explain what it would be generally necessary to undertake in works of repair to secure a part of the fabric of the portico or narthex of Peterborough Cathedral from further dilapidation, and to strengthen and secure it for generations to come in its present authentic condition and appearance, and thus avoid the resulting calamity if the proposal to pull down and rebuild the greater part of the northernmost arch and its spandrels, with the gable over the same, were carried out.

To avoid confusion in the explanation which follows, we shall call those parts of the cathedral which are proposed to be dealt with:—

First, the narthex, which is a triple arched vestibule standing some 16 or 17 feet (inside measurement) in front of the west wall of the church, carried by two triangularly planned piers, and supported by two stair turret wings at the north and south angles.

Secondly, the interposed porch, a construction built in between the two piers, about the end of the fourteenth century, to steady and stiffen these two important supports.

Thirdly, the western wall of the church to which the narthex is attached.

"From the works of sustentation undertaken at various dates there can be no other reasonable conclusion than that the foundation on which the whole building stands is of unequal strength horizontally, for several parts of the church, of greater weight than the narthex, have shown little or no signs of having given way; while the two detached piers, especially the northern one, showed signs of depression early in the history of this thirteenth-century work. Therefore it can but be concluded that the leaning of the piers and disturbance of the superstructure were caused by the weakness of the foundations, though the settlement has been singularly gradual. The external signs of the effects of depression are only what would be expected from a slow movement, otherwise the displacement

of the ornamental facing work would have been more serious than it is.

"The internal parts of the superimposed walling also show the signs resulting from slow settlement, for that part above the springing of the northernmost arch has expanded from east to west as the detached pier under it leaned outwards.

"The foundation of the northern of the two detached piers should first receive particular attention, though the southern pier would also have to be looked to in the same way. With these piers is of course included the strengthening work of the interposed porch.

"The difficulties of strengthening old foundations are necessarily considerable; still, in this particular case they are less so than might have been supposed, for the weight of material balanced on the pier in question is comparatively trifling, and the opportunity afforded by the open character of the situation would allow of ample security being taken to avoid misadventure; but these precautions should be both extensive and particular.

"Before in any way opening or disturbing the ground about the foundation of the northern of the two piers, a carefully designed framework and centering of timber to this pier and its northern arch would have to be set up, which should effectually support and sustain the superimposed weight of the work resting on the capital of this pier and the pier itself. Centerings should also be at once applied to the other two arches for the purpose of steadying them while dealing with the northernmost pier and arch.

"Care must be used in preparing heavy timber sills properly arranged and bedded on the ground level, on which the timbers supporting the cradling and centering are to be erected, bearing in mind that sufficient space be allowed for getting at the foundations of the pier itself and of the porch attached to it.

"The pier in question would then have to be in every fit way supported, secured and protected from injury, as also the pier, archway and window opening of the porch itself.

"Two continuous lines of horizontal timbering would have to be applied extending the whole length of the front on the inside of the narthex; one against the western wall, the other directly against the piers. They should be supported on upright and diagonal beams, probably at the level just under the capitals of the pier shafts. This horizontal beam work inside the narthex should be in right relation to a parallel beam and support work of the same kind on the outside, three longitudinal beams in all. These should be connected by cross and diagonal timbers and

\* Owing to the refusal of the Dean and Chapter to allow any notes or measurements to be taken for this specification, it has not been possible to publish any of the diagrams, which ought properly to have accompanied and explained it. The examination of the building had been made at various times before this prohibition by each of the five architects whose names are attached to it.

iron tie-rods so as to become one continuous stiffening of the whole front of the building.

"From the timber cills on the ground supporting the upright posts carrying this horizontal framework, the necessary diagonal shores and strutting would have to be fixed, so that the horizontal framework would be stiffened back to the west wall of the church in combination with the special diagonal shoring against the centre of the pier itself. On this framework other horizontal timbers running east and west would be carried out to support the walling and gable above, in connection with other timbers passing through the small windows at the base of the gables.

"The centering of the northern arch should be composed of a series of supports, scribed to the several orders of the arching, according to the various irregular curves of these orders, and their outer edges should be covered with dry hair felt, to avoid injury to the faces of the stonework.

"The centering to the ribs of the vaulting of the narthex would also have to be made in like manner, and, with the centerings of the arch itself, be supported from the horizontal framework described above.

"As we attach great importance to every part of this supporting framework and centering, it would not only have to be carefully designed, but should be adapted to the exact peculiarities and irregularities of the work against which it would be set up.

"This shoring, strutting, cradling and centering should be so effectually contrived that this part of the narthex would be securely sustained from the ground upwards, and in the direction towards the west wall of the church.

"When all possible precautions have been taken to secure the building from movement, as it now stands, the underpinning of the pier in question, with that of the porch in attachment to it, should be undertaken.

"The course of proceeding would be regulated by the state of the foundation, when it is partly or wholly exposed to examination.

"The vital principle of underpinning is that of gradually working under the superstructure by removing the old defective work, and substituting new material on a sound base, piecemeal.

"We believe that simple underpinning from the sound work of the present foundation down to the rock below could be done without serious difficulty if the excavation were properly secured with strutting and planking, patiently and skill-

fully applied. The surrounding earth should be efficiently clay-puddled behind the planking (which would be driven down on to the rock below) so that any necessary pumping should not draw off the water and sand from outside the trenching.

"It might be found necessary or advisable when the foundation of rock is reached to bore into it to ascertain the thickness of the rock itself, and the character of the soil below.

"The underpinning would, of course, be done in detail, bit by bit, in sound hard-burned tough brickwork set in Portland cement and sand mortar, properly wedged and tightly pinned, the mass being attacked from different points of it, one after the other. Hereafter we will discuss the quality of the sand and cement to be used, the making of the mortar and its application.

"It must be clearly understood that the whole of the foundation of this pier and that of the attached porch must be completely underpinned; for if only parts of it were so treated, a very mischievous difference in the support to the work above would occur, and cross strains be set up which would gravely endanger the substance of the main pier itself.

"In the construction of the supporting framework or the underpinning, it might be well to call for the assistance of a skilled civil engineer in conference, whose experience and scientific training would add much to reducing all risks to the least possible amount. The architects, who would have greater experience of the characteristic qualities of ancient walling, as distinguished from modern building, would necessarily retain their general direction of the works, but any difference of opinion between them and the engineer should be settled before any process is proceeded with.

"It should not be forgotten that the timber framed supports, vertical, horizontal and diagonal to the whole of the fabric to be dealt with as above described, would so take off the larger proportion of the superincumbent weight as to make the underpinning a perfectly secure process. At the same time it must be understood that careful and persistent watching of the building when applying the supporting constructions would be very necessary, so that every sign of possible weakness might be met from time to time as the different works were being carried on.

"The underpinning and other underground work of this pier and that of the attached work of the porch having been secured, the attention of the architects would be given to making searching examination of the condition of the foundations of adjacent parts of the fabric, so that any necessary

works to these in connection with the parts, under our particular consideration would be as carefully attended to.

"The next work would be to look to the condition of the pier itself, between its foundations and the springing of the arch and vault; this would not be the least important part, for much would depend on its solidity.

"It is possible that disintegration may not have occurred in its substance to any serious extent, but this would have to be ascertained. The signs of its condition, so far as they can have been observed at present, tend rather to the conclusion that the subsidence and pressure outward from the vertical have been so slow from the time it was built, that the multitude of its parts have yielded, almost elastically, to the change in stability, so as not dangerously to decompose its parts, and the core with its ashlar casing may still be in a state of cohesion.

"However this may be, no pains should be spared in finding out what is its condition; and, after the plumbing, girthing and testing of all its perpendicular lines have been done, the pier should be gently tapped with a wooden mallet on its surfaces, and the sounds at different parts listened to for any indications of hollowness. Should the sounding not be satisfactory, a stone or stones would have to be drawn from the flat surfaces of the pier inside, and the core examined in one place at a time. The triangular form of the pier in plan, and its being some 15 feet wide on its inner side, would allow of the examination being made without risk and of the core being consolidated without serious difficulty in a similar way to that hereafter described in connection with the spandrels of the great arches. Any process of penetrating securely into old walls depends upon the care and ingenuity of the men engaged in the operations and their director, with an avoidance of heavy blows, keeping to one hole at a time, and that of the smallest workable size, a watchful foreman of the works, under the direction of the architects, with a few picked men on whom they could depend, being the most important consideration in such work.

"This pier, on which so much depends, having been secured in the whole of its height, attention would then be given to the springing line of the great arch and the vaulting, for complete consolidation here would be the basis for securing the great arch itself and the spandrels right and left of it.

"Of necessity, a hole or holes would have to be made just above the springing line inside, where the metal tie rods, which would have to be arranged at this level, would come. At present we are of opinion that two tie rods should be used, so

as to lay hold of a larger body of material at both ends than a single rod would allow.

"The particular size and form of the rods would depend much upon the exact calculation of the holding, both on the arch mouldings as they set down on the capital of the pier, and on the least injurious form of anchorage to be found inside the west wall of the nave. At the present time we feel inclined to put a connecting metal plate at the ends of the rods a little behind the quintuple attached shafting, which runs up from the ground to the base of the pinnacle between the spandrels. The form and exact position of this connecting-plate would have to be decided upon as the work proceeds. Two tunnel passages, to be made in the same way as hereafter described, would be the safest and soundest way of working here, and it may be that copper or tough bronze would be used for the rods, &c., or, if not, the most approved kind of iron or steel; in either case their strength would have to be tested before using. The making of one tunnel at a time would allow of taking greater pains with the new consolidating material to meet the strain both above the springing line and below.

"The consolidation of the walling here, in connection with the tie-rods, having been done and allowed to set, the tympanum space at the back of the pier, between the decorative arching and the wall rib of the vaulting at the base of the great pinnacle, would afford easy and secure access to the core of the walling in the centre; and further penetrations would also be made without difficulty or risk from the hollow pockets of the vaulting right and left.

"We now come to the very important point in connection with the present repair of the front, the manner in which the great arches can be safely and securely strengthened without having recourse to rebuilding.

"It has already been noted that the internal parts of the walling of the northernmost arch have expanded from east to west during the slow settlement of the detached pier below, and in a lesser degree this is probably the case in the other arches also. The substance of this walling must, therefore, to a greater or less extent, be in a state of disintegration, and its removal and replacement by sound masonry are essential to the permanent stability of the narthex. The manner in which this may be done without risk or danger either to the building itself or to the men engaged in the work is as follows:—

"In the rubble walling, which has no ashlar facing at the back of the arches, beginning at the lowest point, a hole or tunnel, just wide enough for a man to work in, would be slowly

driven by short sections at a time. The sides and roof of each section would be made absolutely secure by timber framing before beginning the next one, and the hole would be gradually carried through the wall to the back of the facing stones of the wall itself. The hole would in no case exceed 6 feet in length. Any possible danger from the running of disintegrated material would be met by the prompt application of short lengths of 3-inch planking, thickly coated with wet clay, and held in position by workmen while props with expanding screws are applied to the ends, so as to press each plank well home and keep it in place. Moreover, only one tunnel would be made at a time, and this would be filled and pinned up (with sound material, as hereafter is described) before another one is begun; it would, therefore, bear but a small proportion to the area of the wall bored into. The new filling would thus support the work above it until that in its turn was removed.

Clearly, when doing this underbuilding in the spandrels of the arches, the chief danger in underpinning foundations—namely, the great superincumbent weight—would practically be non-existent, owing to the comparatively slight structure of the gable above. The only danger to be faced, the possibility of the sides or roof of the holes falling in, would be effectually guarded against by the precautions already described.

The process of consolidating the walling of the west front, above the piers and overlying the arches, is simplified by the great thickness of the walling at this part of the work under consideration; and the foregoing indication of a very complete system of timber support to all the weight and thrust of the work above the springing line of the arches shows that any disturbance caused by the execution of the work would be met at all points by the counter support. Extra support in detail would have to be supplied from time to time, so as to make sure that no further dislocation of material would happen, as the supporting framework would be brought into action as soon as the slightest movement took place.

The principle underlying this working by tunnel into the walling from the inside, at the back of the ornamental ashlar stonework on the outside, is that of applying horizontal bands of very hard material at certain distances apart vertically, so as to become, as the work proceeds upwards from the springing line of the arch, something analogous to 'cantilever' construction used in modern iron bridges, that is, a corbelling out right and left from the central axis of the piers below till the bands from opposite sides meet over the centre of the arch between its two piers. The bands of hard horizontal material

thus act as ribs, and the filling-in between them as support to the ribs.

As has been said before, the very thickness of the walling is of assistance to this kind of work, for these bands or ribs, having a great horizontal width, have also considerable power in lateral resistance to bulging.

As this laminated corbelling and its interfilling is passed on to the outer surfaces of the arching, the weight before carried by the arches alone is then shared by the renewed core of the walling. Also, while this process of relief and strengthening is going on, each of the orders of the arch is caught up and securely connected by natural adhesive bonding, or, when needful, by dowels of hard material, and at the same time the spaces between the rings of the arch, which have opened on account of settlement, would be securely filled and incorporated with the work behind.

The horizontal bands or ribs, which were constantly used in the best Roman walling, served more than one office in construction, as they were, so to speak, built in compartments, and the rubble or concrete lying on this laminated bond of two or three joint-broken courses stopped the running down of the water from the new rubble above them to the rubble below, that having already been saturated with grout.

It must also be understood that these laminated bond courses would be of the whole thickness of the wall from the back of the facing stones to the inside face of the wall lining, and on these would be built or put in the rubble or concrete filling. While the work in each tunnel was being done these horizontal bonding courses would be thrust into and under the sides of the walling of the holes beyond the general width of each tunnel; so that after one tunnel was filled up, and a sufficient time was allowed for setting, another parallel tunnel would be made, and these outlying bond courses would be caught up at the base of the fresh hole, and a continuous line of them would run as far as different circumstances would allow.

The kind of materials to be employed in recoring and bonding together old walling is a very necessary condition for insuring permanent success. As is well known, underpinning in the ordinary sense is done at the base of the walls and mostly underground, the materials used being either sound brick or tough stone, with Portland cement and coarse clean sand for the mortar, and thin material, such as tiles or slates, for pinning and wedging.

Only in carefully-directed work is much attention given to the proportion of the materials for the mortar, and as the work

READING CASES for THE ARCHITECT.  
Price 2s.—Office: 175 Strand, London, W.C.

is generally underground, more license is allowed in proportioning the cement to the sand than would be fitting for work as here described, where the quality of materials and their proportion in use must be strictly attended to. The competition in the manufacture of Portland cement is so keen that large quantities are produced and sold which are wholly untrustworthy; every care must therefore be taken to use only that which will stand the recognised tests of fitness. Its special quality has to be guarded against, for in its use it first expands and then contracts; but this is negated to a considerable extent when it is used underground and is less affected by the atmosphere. If used above ground the proportion of cement to sand must be reduced to a minimum; for though cement mortar is chiefly used for its quick setting, the final consolidation should take considerable time in developing itself.

"In order to make the horizontal courses or ribs as strong as possible, we should mostly use the hard, blue Staffordshire paving-tiles,  $1\frac{1}{2}$  inches or 2 inches thick, of the size 12 inches by 6 inches, with smaller sizes of the same material to avoid cutting. These semi-vitrified tiles have great affinity with Portland cement and are very holding.

"We have specified rubble walling or concrete as the composition of the filling-in between the tile-bands, but this work would be varied by the differences found to exist in the work of the core. Any solid parts of the core which might prove not to have been disintegrated would be well washed and then laid hold of with new thin bonding-stones or flat bricks, so as to range horizontally with any of the work met with on the way, which should not be disturbed; but the particular use of rubble concrete is great, for it can be pressed into the interstices of old walling and lays hold of any connecting bonding from the internal irregular faces of the ashlar or other facing stonework. At different times from the end of each tunnel, parts of the ashlar facing would be exposed to view and all the gaps in it could be securely dealt with; the renewing of the bedding and pointing of the stones (an almost impossible work from the outside only) would be thoroughly secured and attachments incorporated with the new backing.

"It is highly probable that the quintuple shafting, up from the springing of the arches to the underside of the base of the great pinnacle between the roofs, will have been built back with much cube stone, and if this is found so, it will not have to be disturbed (unless in any way dislocated), but carefully embodied in the new filling in and band work of the spandrels.

"So far as can be seen at present, the internal support at the base of these pinnacles is of solid and unfractured work, as is also much of the work of the gable proper, though here fractures or displacement of the stones would have to be dealt with, especially along the range of alternate window opening and niche-work.

"The gable proper, that is the triangular part resting on the continuous dentilled string-course, would present few difficulties in securing it after the strengthening of the foundation on which it stands (*i.e.* the spandrels of the arch below it) had been consolidated. The alternation of windows and niches occurring in thinner walling than that covering the great arch, a far larger part of the work here is done in squared stone, and this would allow of the masonry under the base of the wheel window being made quite sound from the inside, so as to avoid displacing the weather-fretted stones of the bottom part of its circle; the joints of this stonework at this point could be thoroughly washed out from above, run in with new filling, and incorporated with the solidified work below, which would have been done from the inside. Any disturbance of the ornamental stonework on the outside would be most mischievous.

"Doubtless as the work proceeds from time to time at the different parts of the walling, any scheme set down on paper now would have to be modified to suit the peculiarities of the various works as they become disclosed; caution while each part was being dealt with would have to be insisted on, and special contrivances put in practice to suit all situations.

"Though, for the purpose of this specification, the crowning and gable to the northern arch only is supposed to be dealt with, the whole line of work between the stair-turrets would have to be taken into account on one system of horizontal and lateral strengthening.

"We would, for example, here note that the whole of this western front of the building should be considered as necessarily included in the general scheme of repair (though it cannot be dealt with here particularly), and the central porch at the base of the two piers having for so great a length of time been of such vital importance in securing the stability of the building, should have its defects made good and additional strengthening supplied from the base of the new foundation (already noted) to the roof of it, and the condition of its attachment to the two great piers and western wall looked to.

"Again, while the works of support described above were in progress, the old system of timber beam and iron tie work now existing and carried back to the east side of the towers would

have to be overhauled, any weakness observed and remedied, and, perhaps, additional support supplied. This would also have to be considered with the possible attachment of further stays and support to the vertical walling of the gable itself from the inside; for, although the internal piers right and left are built out eastward, with a passage through them, and give extra support to the pinnacles, it is not so with the gable. Though this is not in what would be called by builders a bad condition, it would be wise to give it additional support on the inside, which could be very simply done, and the connection of the roof beams with it could be better secured, and made, when properly strengthened, a steadying power to the gable itself.

"We need scarcely here say anything as to the repair and strengthening of the vaulting in connection with the great arch at this part of the front, save that we were much interested in the varied curves of the ribs resulting from the slow strain put upon them by the settlement of the piers; but they present no serious difficulty in the way of strengthening them as they now stand, when once the work on which they rest and abut is made secure.

"In handing to the Society of Antiquaries this necessarily incomplete specification, we would add that, when considering the different points somewhat more in detail, as set down above, and after our examinations of the building from the scaffolding, we were sorry not to have been favoured with further opportunities of taking notes and measurements of the fabric. This would have enabled us to make it as clear to the public as it is to ourselves, that there is no necessity whatever for the taking down and rebuilding of this most remarkable addition to the west front of the cathedral, as proposed by the advisers of the Dean and Chapter of Peterborough. It is in no immediate danger, as was quite evident to us when at last the scaffolding was set up, and the present condition of the building could be scrutinised closely. This study clearly proved to us that it could be both securely and lastingly repaired without detracting from those refined and impressive qualities which go to make a work of such majestic and still uninjured beauty so precious an heirloom to a nation.

"THACKERAY TURNER, W. R. LETHABY, DETMAR BLOW, PHILIP WEBB, J. T. MICKLETHWAITE."

"Having carefully examined from the scaffolding the west front of Peterborough Cathedral, I am of opinion that the work described in the above specification could be safely carried out, and that it would be effective in making the building secure."

"JOHN CARRUTHERS, M.Inst.C.E."

"We, the undersigned architects, have not examined the west front of Peterborough Cathedral from the scaffolding, but we are of opinion that the methods proposed in the above specification are eminently practical, and they are such as we should recommend for repairing work of this nature.

"ROBERT WEIR SCHULTZ, F. W. TROUP, EDWARD S. PRIOR, F. INIGO THOMAS, HALSEY RICARDO, MERVYN MACARTNEY, P. MORLEY HORDER, J. A. COSSINS (Birmingham), H. WILSON, ERNEST NEWTON, E. GUY DAWBER, C. R. ASHBEE, J. J. STEVENSON, F.R.I.B.A."

The following communication has been sent to the Dean of Peterborough:

"We, the undersigned architects and surveyors of Leicester (being the largest town in the diocese), having full confidence in the judgment of your architect, Mr. J. L. Pearson, R.A., and knowing from what he has done in the past that any work he does to the west front of Peterborough Cathedral will be of the most reverent and conservative character, beg to forward a subscription of 71% towards the fund you are raising for the restoration of this unique portion of the cathedral of our diocese.—R. J. Goodacre, J. Goddard, J. B. Everard, S. Harrison, J. Goodacre, C. Baker, S. P. Pick, A. T. Draper, W. E. Keites, W. H. Simpson, F. Seale, H. C. Taylor, A. H. Hind, T. W. Pettifor, E. G. Mawbey, borough surveyor, T. Topott, T. P. Bown, H. A. Roehling, A. S. Gimson, W. A. Catlow, W. M. Cowdell, J. W. Simpson, J. Wigg, A. E. Harvey, J. Lancashire, W. T. Grewcock, F. B. Cooper, A. Herbert, W. E. Moore, H. F. Traylen, R. W. Bedingfield, A. E. Sawday, G. Brown, J. T. Blackwell, W. Keay, C. Ogden, P. C. Mawbey, R. J. Stephens."

A meeting of the cathedral restoration committee was held at Peterborough on the 7th inst. A long discussion took place on the proposals of the Society of Antiquaries with regard to the west front, but the suggestion to refer the matter to arbitration was not entertained. Mr. John Thompson, the mayor of Peterborough, who is the contractor for the work, said he would not risk the lives of his workmen in attempting to carry out the scheme of the Society. Eventually it was proposed by the Marquis of Exeter, seconded by Canon Watson, and carried unanimously, "That this committee, having heard from the Dean and Chapter the report of their proceedings in support

of the resolutions passed by us on November 25 last with reference to the north-west gable of the west front, assures them of its entire approval of their action and requests that the contractor be directed to proceed at once with the work. The treasurer announced that a little over 300% had been received in subscriptions since the last meeting.

### GLOUCESTERSHIRE ENGINEERING SOCIETY.

A MEETING of this Society was held at the School of Science, Gloucester, on the 5th inst., under the presidency of Mr. Alfred Slater. The President referred to the reading-room and library which the Society had now opened at Arrow House, Southgate Street, and thought that the number of new members just nominated (the largest number that had up to the present been nominated on one evening) showed that the Society had taken a step in the right direction, and he hoped that heads of firms and others interested in the rise of machinery and manufactures would take special interest in the affairs of the Society.

The Librarian reported that the Society now possessed 180 volumes, and he had great pleasure in stating that during the past week about 100 standard books, periodicals and photographs of a technical character had been lent to the Society by gentlemen and firms, to whom he now proposed that the best thanks of the Society be tendered.

Mr. H. W. Kolle, C.E., delivered a lecture upon "Water Tube Boilers," illustrated by a model and by diagrams shown by limelight. He explained the circulation of water in steam boilers and gave a history of water-tube boilers, their construction, erection and operation, and also discoursed upon the theory of steam generating, and dealt fully with the advantage of this type of boiler in its maintenance and evaporative power, with regard to economy and safety, and also detailed the requirements of a perfect boiler.

The President proposed a vote of thanks to the lecturer for his excellent paper, saying that the present shell boiler seemed to be one working against itself, but that the water-tube boiler, in which the circulation was more complete, and by which refuse, sawdust and other waste products and materials could be used for the generating of steam, was tending towards his idea of perfection, and he further described some experiments he had been trying upon the burning of sawdust by means of its explosive qualities.

Mr. Jas. Platt, in seconding a vote of thanks, said that this kind of boiler had had a severe struggle in this country as compared with America and other countries, but that Messrs. Babcock & Wilcox's type still maintained its position, as they were making at present three boilers a day. He added that the Lancashire boiler had been greatly improved, and when properly managed was equal to any other boiler. The water-tube boiler required more close attention than other boilers, but was a splendid one for generating steam; he referred particularly to the water-tube box as an admirable piece of workmanship, and mentioned that his firm were the first makers of the special rivetting machine and plant connected with this boiler.

Mr. Read, the city surveyor, in supporting the motion, expressed his indebtedness to the lecturer for his interesting lecture, and spoke of the suitability of this boiler for the disposal of refuse, and for the generating of steam for electric-light purposes, and made some observations on the expansion of the tubes.

A discussion followed, in which Mr. Walton, Mr. Seekings and other members took part.

Mr. J. W. Howard, the president, announced that the next meeting will be held on February 2.

### THE OFFICES OF THE SEWERS COMMISSION.

THE new offices of the Commission of Sewers, facing Basinghall Street, says the *City Press*, are not in accord with the principal architectural features of that well-known thoroughfare. The reason for this departure is not far to seek, as the Commission, under an injunction, unsuccessfully resisted by that body, has been unable to complete the original plans of the building. The question of ancient lights, which was raised by the opposite tenants, has proved fatal to the intention of the Commission to erect a handsome structure facing the street. The fact that someone has blundered is now only too painfully apparent. How the error occurred is a mystery, for it ought to have been elementary knowledge to those concerned that the question of ancient lights would prove a formidable, if not a fatal, obstacle to the execution of the original plans. For the oversight the Commission has had to pay very dearly by the mutilation of the original scheme. Instead of having a compact structure rising in a line upward from the street, the

Handsomely bound in Cloth, Gilt Lettered. Price 12s. 6d. Office: 175 Strand, London, W.C.

new building will be erected in terraces, culminating with a steep roof at the rear. It is needless to say that much valuable space has been sacrificed in order to conform to the requirements of the injunction. The half-basement will be devoted to the clerks' strong-room, 34 feet 2 inches by 17 feet; a room for the gas inspector, 15 feet 3 inches by 17 feet; rooms for the sanitary inspectors, 27 feet 6 inches by 19 feet 6 inches, and 19 feet 6 inches by 17 feet 6 inches respectively; an office for the electrical engineer, 12 feet 6 inches by 19 feet, and his testing-room, 17 feet 9 inches by 19 feet. The ground floor will provide accommodation for the clerk, his room being 27 feet 9 inches by 15 feet; the second clerk's room, 13 feet 3 inches by 14 feet; the clerks' general office, 36 feet by 18 feet 6 inches; with waiting-room for the messengers, 15 feet 9 inches by 17 feet 6 inches. There is also a room for the accountant, containing an area of 220 feet superficial; with lavatory and w.c. accommodation for the staff. The office for the medical officer will also be on this floor, its dimensions being 20 feet by 15 feet, and that for the sanitary clerk is 15 feet by 11 feet. The first floor will accommodate the rate collectors' office, 16 feet by 18 feet 6 inches, and a private room, 15 feet 9 inches by 17 feet 6 inches, for the copying and general clerk in connection with the clerk's department. The principal entrance to the building will be from Basinghall Street, at the southern end, with staircase and a lift for passengers, giving access to each of the floors. A separate lift for books will also be provided. The offices now occupied by the engineer and his staff will be retained in their present position, and access will be given to them by a staircase and corridor leading from the new building.

### MANCHESTER ASSOCIATION OF ENGINEERS.

AT a meeting of the Manchester Association of Engineers at the Grand Hotel, the president, Mr. Joseph Nasmyth, said in his inaugural address that the past year had been noticeable in particular in that it had probably seen the high-water mark of panic which occasionally seized the public mind with regard to our industrial prospects. There was convincing evidence that we had no cause for serious alarm, although there was plenty of room for increased vigilance. Among the factors which affected the problem there were three which had supreme influence—the economic effect of improved appliances, the adoption of the best commercial methods, and the fullest

development of the skill of all those engaged in an industry, and especially of the leaders. In all engineering industries, and more especially in those in which machines of one class containing a number of similar parts were made in large quantities, the most complete system of employing special appliances was found. But it was equally true that in other industries, apparently much more simple in their nature, such as, for instance, the manufacture of iron and steel, the same process had been going on. Thus in the production of steel rails this generation had seen an enormous advance. One of the direct consequences of the adoption of the newer methods and appliances had been such a subdivision of some operations as to involve a fresh organisation of labour. In this way there had been silently worked a revolution which was not always fully appreciated even yet, and which had had no less an effect than the elevation of the machine-tender from a subordinate to an important position in the economy of a workshop. It was in consequence of the facility of subdivision which the ingenuity displayed in the production of special appliances had brought about that in all organised industries the labour cost of an article continually tended to decrease. It was obvious, however, that any such method could not produce handicraftsmen, nor, on the other hand, did it call for them. The unfortunate part of the matter was that the system tended to lower the general standard of skill, and thus, unless some other means were found, gradually caused a deterioration in the men available when the occasion called for them.

### ST. PANCRAS, SEFTON PARK.

THIS new mission church, which was opened this week, has been erected on a piece of land measuring 2,500 yards at the corner of Lidderdale Road, near the junction of Smithdown Road and Ullet Road, and is at the furthest corner of the parish of St. Agnes's Church, and will subsequently be used as a parish room and Sunday school, &c. Adjoining this is the choir vestry, and between the latter and Lidderdale Road will ultimately be built a permanent church capable of accommodating 800 people. Pending the erection of the sacred edifice the services will be conducted in the mission church. It is a substantial room of 60 feet by 30 feet. The ceiling has a height of 29 feet. The roof is of the tie-beam form in pitch pine boarded at the back of the rafters, and the floor is of pitch pine blocks laid upon concrete. At the west end there is a gallery,

LIBERAL DISCOUNTS ACCORDING TO ARRANGEMENTS.

## TO PREVENT CISTERNS AND PIPES FREEZING.

### THE UNIVERSAL LAGGING COMPANY, LIMITED,

Supplies an unequalled composition for Coating Cisterns and Pipes, preventing the formation of Ice in Cisterns, and the Bursting of Pipes in Private Houses and Public Buildings; Refrigerators and Refrigerating Sheds. Lining Corrugated Iron and Wooden Buildings, also Boilers (Marine and Stationary). Used by the Admiralty, and the leading Water Works Companies.

FOR FULL PARTICULARS, TERMS AND TESTIMONIALS APPLY TO THE SECRETARY,

**3 CROSBY SQUARE, E.C.**

AWARDS OBTAINED: LONDON, 1862, 1874; PARIS, 1867, 1878; CHICAGO, 1893.

## BEDFORD LEMERE & CO., ARCHITECTURAL PHOTOGRAPHERS

To Her Majesty the Queen and Royal Family; H.M. Office of Works; H.M. Office of Woods and Forests; the London County Council, &c. Photographs taken and proofs delivered same day. 50,000 Architectural and Decorative Views. Price List and Catalogues Free.

**147 STRAND, LONDON, W.C.**

one-half of which will accommodate between forty and fifty persons, while the other half contains the organ. The building is of grey brick with red brick quoins and Rainhill sandstone dressings to the doors and windows. It is lighted with clerestory windows from one end to the other, and at the east end is a fine window of ecclesiastical design, all the windows being glazed in tinted lead lights. The choir vestry measures 23 feet by 16 feet, and the roof is panelled in pitch pine, while there is a dado 5 feet high of the same wood. The lead glazing has been executed from the architects' designs by Messrs. Williams & Watson, and the zinc roofing by Braby & Co., both being Liverpool firms. The architects are Messrs. H. & A. P. Fry, Liverpool, and Messrs. Morrison & Sons, Wavertree, have been the general contractors. The cost of present building and fitting-up is about 3,200*l*.

### NEW CHURCH AT ALSAGER.

THE recently erected church of St. Mary Magdalene was dedicated on the 8th inst. The building is a handsome one of Alton stone, and has been erected by Mr. John Fielding, of Alton, Messrs. Austin & Paley, of Lancaster, being the architects. The tower and spire are left to be provided by later effort, and will add considerably to the present stateliness of the structure. The church is in the Decorated style of architecture, and consists of a nave and chancel 26 feet wide, north and south aisles opening into nave by arcades of five bays each, and organ chamber on the north side of the chancel, with spacious choir and clergy vestries opening out of the same. The church will be entered at the west end by north and south porches, both of which open into the tower, which is 16 feet square and forms the baptistery. The tower will be surmounted by a spire. The total length of the church is 124 feet, and the width across the nave and aisles 56 feet. The portion now carried out consists of the chancel, organ chamber and vestries, the nave, with the south aisle and a portion of the north aisle, the south porch and the lower portion of the tower to the level of the roof of the nave. The church is seated at present for 450, but will eventually accommodate 700 people. The cost of the present portion will exceed 8,000*l*., an additional sum of 1,500*l*. being required to complete the tower and spire. The roofs, seats and dados are of pitch-pine, and the chancel seats, altar rail and altar table of wainscot oak. The roofs of the nave and chancel are covered with red Staffordshire tiles and

of the aisles and porches with lead, the ceilings throughout being boarded. The heating is effected by hot-water pipes on the low-pressure system, carried along the main passages in channels below the floor, with coils of pipes in the window recesses, &c.

### PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

WINCHESTER.—Jan. 25.—For additions, alterations and repairs at the prebendal house, 4 The Close, and for the conversion of the same into judges' lodgings, for the Very Rev. the Dean and Chapter. Mr. J. B. Colson, architect, 46 Jewry Street, Winchester.

WINCHFIELD.—Jan. 29.—For erection of additional vagrant wards at the union house. Mr. F. S. Chandler, clerk, Oldham.

WOOLWICH.—Jan. 26.—For erection of a fire station at North Woolwich. The Architect's Department, L.C.C., 21 Whitehall Place, S.W.

PEACE & NORQUOY, builders and contractors, and manufacturers of patent folding partitions for schools, public buildings, &c., have, in consequence of the great increase in their business, removed from Port Street, Manchester, to the New Islington Steam Joinery Works, Union Street, Ancoats, Manchester. The new premises are large and commodious, and have been well fitted up with all the most improved wood-cutting machinery, which has been put down by W. B. Haigh & Co., Limited, Oldham. No detail has been overlooked, all the departments incidental to a large timber, joinery and contracting trade being fully represented, and the firm deserve credit for the superior equipment of the entire place.

Pickle Bros., slater.  
Total, £919 7s. 4d.

## TRADE NOTES.

MESSRS. GEORGE PRICE, Limited, bankers' engineers, Cleveland Street, Wolverhampton, are to be congratulated upon securing probably the largest order for safes ever placed with a local firm, viz., 400 cash safes for the Admiralty. They are also engaged upon some massive strong-room doors for the new Humber factory at Coventry, and have supplied them with all their "bent-steel" book and cash safes. A "bent-steel" safe is also in course of construction for his Grace the Duke of Portland. From the foregoing it would appear that Wolverhampton manufactures are still keeping well to the front.

DARLEY ABBEY CHURCH, near Derby, has just been presented with a handsome brass eagle lectern by a member of the congregation. It was manufactured by the well-known firm of Messrs. Jones & Willis, of Birmingham and London.

IN the erection of the Non-Infectious Hospital, Rothesay (Mr. J. Russell Thomson, Rothesay, architect), the ventilation has been carried out by means of Messrs. Cousland & Mackay's patent direct-acting turret ventilators and improved air inlet brackets, which have been supplied from their works at Glasgow.

THE new free library, Harrogate, is being warmed and ventilated by means of Shorland's patent Manchester stoves and patent exhaust roof ventilators, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

MESSRS. WRIGHT & SUTCLIFFE, Globe Sanitary Works, Halifax, have recently brought out an improved combination kitchen and scullery sink, which they fitly describe as a novel departure. The drainer is not made of the same material as

the other parts, as heretofore, but consists of a strong corrugated piece of indiarubber, specially moulded for this purpose, firmly attached to the sink. By this arrangement, owing to the non-slipping and pliable properties of the drainer, a great saving in the breakage of and damage to crockery, glass, &c., is effected, an advantage which will be appreciated by heads of families, hotel proprietors and restaurateurs.

THE Thames Bank Iron Company, Upper Ground Street, S.E., have sent in a price list of their new radiators for hot water or steam. These radiators possess a large proportionate heating power as compared with some others in the market, having in fact an efficiency equal to from 18 feet to 102 feet of 4-inch pipe, and the prices vary from 17. 16s. to 127. 15s.

## BUILDING AND BUILDERS.

A COMMITTEE, consisting of the Mayor of Newport and other gentlemen, are on the look-out for a site on the Corporation Road on which to build a new church.

A NEW United Methodist Free Church is about to be erected in Loughton, Pudsey, for which the contracts, amounting to nearly 7,000l., have been signed. The new building is to occupy the same site as the present chapel.

SOME scaffolding in Sauchiehall Lane, Glasgow, fell on Monday, and four labourers—John Macinulty, John Docherty, Alexander Macdonald and Thomas Fitts—were seriously hurt. The injuries consisted of broken limbs and fractured skulls, and all four men had to be removed to the infirmary.

THE building of a new Catholic church at Eccles will be begun in the spring. The new church, which will be in the thirteenth-century Gothic or Early English style, will cost 6,000l., exclusive of the tower, and will seat about 650 persons. The church and presbytery will adjoin the present mission schools in Liverpool Road.

THE work of constructing a large reservoir and other waterworks at Springsmire, Dudley, for the South Staffordshire Waterworks Company, has been commenced, the estimated cost of which is stated to be nearly 14,000l. The dimensions of the reservoir will be 200 feet by 150 feet, with a depth of 17 feet, the capacity being 3,250,000 gallons. It is being constructed for the purpose of dealing with the water supplied from the company's pumping station at Kingswinford, and for dis-

tributing it to Cradley Heath, Quarry Bank, Pensnett, Kingswinford, Brierley Hill, Hart's Hill and Round Oak. The contract has been given to Mr. H. Lovatt, of Wolverhampton.

### ELECTRIC NOTES.

MESSRS. EASTON, ANDERSON & GOOLDEN, Limited, of Erith, are now erecting a lift, to carry fifteen passengers, at the Kelvin Bridge Station of the Glasgow new district subway. It will be worked by electricity with continuous current and will be fitted with improved safety-gear, automatic stops and other accessories of the makers' latest designs.

OWING to the breakage of the circuit wire, six of the electrically controlled time dials placed at Glasgow street corners stopped on Wednesday in last week. The wire was promptly repaired, but it was impossible to set the dials right, as the Municipal Buildings, where the switchboard is erected, were then closed. Throughout the night the dials indicated two hours behind time.

THE premises of the Crystal Palace District Electric Supply Company (Limited), in Beardell Street, Norwood, have been severely damaged by fire. The insulation of the wires in the engine-room running to the armature had become ignited, and the whole of the motor transformer was involved. The fire was rapidly overcome, but much damage was caused in the engine-room.

### VARIETIES.

MR. H. C. EYRES, whose resignation of the management of the Coalbrookdale Company's London business, and appointment to that of the architectural department of the Falkirk Iron Co., we recently noted, was on Saturday last entertained by the Coalbrookdale London staff, and presented with an illuminated address, together with a handsome piece of plate.

THE N.A.A. Students' Sketching Club seventh annual social gathering will take place in the Grand Assembly Rooms, Barras Bridge, Newcastle-on-Tyne, on Tuesday evening next.

AT Widnes a chimney has fallen on the roof of a large shed belonging to the United Alkali Company and demolished it. A labourer, named Edward Kinsella, was killed, and three other workmen, named Windows, J. Sherwood and Taylor, were injured, Taylor seriously.

A MEETING of the Architectural Association was held on Monday last, when Mr. E. Prioleau Warren read a paper on "Plastering." The report will be published next week.

A NEW post office was opened at Fort William on the 15th inst. The new building, which is large and commodious, is situated in High Street, near the middle of the town, and its construction was rendered necessary on account of the large increase of postal work in that part of the West Highlands.

THE proposed expenditure of Ayr Town Council for 1897 embraces 10,000*l.* on sewerage, 6,000*l.* on iron bridge near station, 8,000*l.* on extension of the waterworks, 1,000*l.* on underground conveniences and 10,000*l.* on extension of electric-lighting plant.

BY the law coming into force in Sweden this year a dwelling-house must not have more than five storeys. An attic containing a stove is reckoned a storey. The height of the buildings must not exceed the width of the street by more than 5 feet. The height of a building will be measured from the street to the cornice of the roof.

A LOCAL GOVERNMENT BOARD inquiry was held at Wigan regarding the application of the Corporation for a provisional order to enable them to obtain a supply of 200,000 gallons of water daily in perpetuity from the Manchester Corporation's supply at Lake Thirlmere. It was proposed to construct a line of pipes from the service reservoir at Wigan Lane to the aqueduct leading from Thirlmere to Manchester. The cost of the proposed work was estimated at about 12,000*l.*

THE premises of Mr. H. Bassant, parquet-flooring manufacturer, 87 Charlotte Street, W., were on Saturday last the scene of a fierce conflagration. The flames burnt very strongly until late at night, and the firemen, working in the height of the snowstorm, presented a remarkable spectacle. Eventually the surrounding premises, though they suffered from heat, smoke and water, escaped serious damage from fire, but Mr. Bassant's premises suffered severely from fire, heat, smoke and water.

MR. HENRY SLATER made an offer to the Gordon Hotels Company, on behalf of a syndicate, to purchase the Metropole Hotel, Brighton, with all the furniture, fittings, fixtures, as it now stands, for the purpose of converting the same into flats. Mr. Coxon, the company's secretary, however, has written stating that his directors have no intention of disposing of the property. An idea seems to prevail in some quarters that flats will shortly supersede hotels and boarding houses at the queen of seaside watering places.

82 BELVEDERE ROAD, LAMBETH, LONDON, S.E.

IN connection with the Morecombe improvements all the landowners, with two exceptions, on either side of Heysham Road from the Battery Inn to Cross Cop, have offered the land free of charge for the purpose of widening the road in question and constructing causeways. The work was expected to be completed during the spring. It is naturally anticipated that Heysham will rapidly develop as soon as the harbour and new station for the Midland Railway Company are completed there. The contractors are pushing on the work in the erection of the Winter Gardens, which it is hoped will be in readiness by Whitsuntide.

THE new Court House, Sheffield, was opened last week by the Mayor, the Duke of Norfolk, in the presence of a distinguished assemblage of local notables. Some time ago the Corporation leased from the Town Trustees 670 yards of land at the rear of the old Town Hall, for 470 years, at a ground rent of 240*l.* per annum. Upon that site has been erected an additional court, solicitors', waiting and other rooms, additional offices have been provided, and twenty-two extra cells for prisoners. There is easy communication between the old and the new courts, and the entire block is convenient and comprehensive. The estimated cost of the additions is about 18,000*l.*

A NOTABLE addition to the architectural features of Reading has just been erected in Friar Street, from the designs of Messrs. Chas. Smith & Son, of that street. It is a range of shops built for Messrs. Fuller & Sons, and arranged for wholesale and retail business, with a suite of offices and clerks' rooms in the rear. Further to the south and east are four storeys of stores approached from a covered yard, entered by the archway which forms a central feature. At the southern extremity are the stables, stores, &c. The lower part of the façade towards Friar Street is built in polished granite, the upper storeys being in local red brick with Bath stone dressings. The buildings are warmed throughout with hot water, and lighted by electricity.

A VERY pleasant and successful gathering took place last week at the Hotel Cecil, when Messrs. S. J. Waring & Sons, Ltd., of Oxford Street, held their first house dinner. Appropriately enough, the gathering took place in the handsomely decorated great hall of the hotel, and it was natural that some of the speakers should make a point of alluding to this admirable example of the firm's artistic work. The chair was taken by Mr. S. J. Waring, jun. (managing director), and he was sup-

ported by Mr. John Waring (Liverpool) and Mr. Giles Ponter (Manchester), directors, and by about 250 members of the London staff and friends. The toast of "The Firm" was very cordially pledged, and the Chairman in his reply affirmed the conviction that the success of the firm was largely due to the devotion and self-sacrifice of its staff. After dinner a musical entertainment brought an enjoyable evening to a close.

THE new Sunday school just erected by the congregation of Zion Baptist Chapel, Bramley, was opened on the 16th inst. The building, which has been designed by Mr. W. A. Hobson, architect, of Leeds, and which is an ornament to the village, stands back from the main road on ground adjacent to that occupied by the chapel. It is a two-storeyed building, faced with stone, and is of a pleasing architectural style. Both the upper and lower storey can be entered from either end of the building. On the ground floor is a meeting-room, with accommodation for 300 people, with eight class-rooms communicating. Spacious staircases give access to the upper floor, which contains a large assembly hall, with seating accommodation for 500 people, two class-rooms and retiring-rooms, and over these, again, there are two more class-rooms. The principal contractors were Mr. W. W. Haley and Messrs. J. Trickett & Sons, and the clerk of works Mr. E. Webster Tate. The building, which is conveniently arranged and well lighted, has cost about 2,500*l.*

THE parish church of Irthlington was opened on Friday last, after having been restored from plans by Mr. T. Taylor Scott, F.R.I.B.A., of Carlisle. This church contains some good examples of thirteenth-century Norman work, noticeably the chancel arch, which is a striking feature of the interior, and is regarded as one of the finest of the kind to be found in any ecclesiastical structure in England. In the work of restoration it is a relief to find that no characteristic of the old Norman work has been interfered with, care having been taken to avoid even cutting the walls for purposes of bond. Where the new vestry walls, for example, abut upon the old chancel, the connection has been made by means of wrought-iron ties. The new vestry is on the south side of the chancel and encloses a Norman doorway, and is designed to harmonise with the adjacent work. A heating chamber is constructed below it, whence the church is heated by the low-pressure hot-water system. The whole of the seating is new and of Dantzic oak. Another considerable improvement is the spacious vestibule constructed of Dantzic oak at the main

entrance. The organ has been renovated by Mr. A. Barton, Silloth. Numerous other works have been carried out, the whole of the contracts having been executed with thoroughness. The cost has been about 800*l*.

### ABUSES OF PUBLIC ADVERTISING.

A CONFERENCE was held in the hall of the Society of Arts, Adelphi, on the 14th inst., for the purpose of promoting the objects of the National Society for Checking the Abuses of Public Advertising. Sir Lepel Griffin, at the request of Mr. Alfred Waterhouse, R.A., president of the Society, who was present, but had been indisposed, took the chair.

Mr. Bryce, M.P., writing to the hon. secretary as to the meeting, said:—"You are certainly right to try and keep the flame alight in this way. After a time the public ear is reached and opinion affected. I am sure also that you are right in thinking that an appeal ought to be made to local opinion and local efforts. I would ballot for Mr. Boulnois's Bill were I not pledged to ballot for another."

Sir Edward Poynter, writing to the honorary secretary, said:—"I send you a few lines in great haste, in answer to your letter received this morning, to say that I am fully in sympathy with the objects of your Society, especially in your efforts to check the needless disfigurement of natural scenery by the conspicuous advertisements which are only too common. Even if the objectionable placards which assert themselves so offensively along some of our principal railways served any public purpose whatever, there would be no excuse for obtruding them just where they can spoil the one pleasure which may be derived from railway travelling—that of enjoying such views of peaceful or romantic rural scenery as are obtainable from the passing train. But it is notoriously the contrary; the advertisements are only in the interests of the advertising firms, and no one can pretend that the public would lose in any way by their suppression. The only argument on the side of the advertiser that I have seen possessing a pretence of plausibility is the appeal *ad misericordiam* which was made on behalf of the impoverished farmer who gains a small annual sum by letting his field for advertising purposes; but no one, I suppose, will contend that the benefit to the farmer enters into the intentions of the advertisers. The argument is a pure after-thought, and only dragged in because there is no other available.

I think you do rightly in not attempting general legislative repression. A world entirely free from advertisements is a dream too enchanting to be realised, and to draw a line by law between what would appear to be legitimate or illegitimate in advertisement would be an impossible task. Local control, with power to deal with the most annoying cases, seems the best method of applying the requisite check, and I should be glad if it were found possible to move the Legislature to this effect. Once such powers were obtained people's natural sense of what is fit and appropriate would lead them to revolt very generally against the irritating and useless disfigurement of the charms of natural scenery which all are capable of enjoying."

Mr. John Richmond, who had taken an active part in the movement, wrote:—"It is, as you say, most urgent that all members of the Advertisement Regulation Society should use individual effort to further the cause both by enlisting new members, by drawing attention to abuses of advertising wherever they occur, and chiefly by bringing pressure to bear on the members of Parliament representing districts in which they are interested, to induce them to ballot for our Rural Advertisements Bill. When once powers of control have been placed in the hands of local authorities, a real beginning will have been made to check effectually what is, I fear, still a growing evil. Much has been done in some districts, notably in the Lake country, by individual protest, and I am told that the boards, which were becoming a hideous eyesore around Windermere, have been literally burnt and purged away." Mr. Richmond added that he was now drawing attention in the local press to some advertising abuses on the sea-front at Hastings, which seriously injured the view of the Old Town, admittedly, he said, one of the loveliest places on the South Coast.

Mr. Lecky, M.P., in his communication, urged in the most emphatic manner the necessity for such legislation as the Society was desirous of promoting.

Mr. Evans, the honorary secretary said that, even if Parliamentary action should at first fail, the Society could reckon on the support of a large amount of social influence and individual effort in promoting the cause at heart. No formal resolutions would be moved, but it was desired to take the sense of the meeting regarding the following steps:—(1) A memorial or deputation to the First Lord of the Treasury or the Home Secretary, to draw attention to the grave harm done by advertising disfigurement, and the certainty that the practice must spread indefinitely unless subjected to reasonable

control; to urge the Government (a) to grant facilities for Mr. Boulnois's Bill, or (b) to introduce a measure of their own, or (c) to grant a Parliamentary committee or a commission to inquire into the subject as one of national importance. (2) A memorial or deputation to the Chancellor of the Exchequer, to ask him to consider the propriety of imposing a duty on exposed advertisements. (3) The establishment of some concert between members of Parliament who are favourable to our cause, for the purpose of introducing (by way of amendments or instructions) provisions in restraint of advertising disfigurement into Railway Bills and similar measures.

The three propositions were put to the meeting, with the result that the first and third were agreed to, whilst the second was negatived.

### THE FUTURE OF CHELTENHAM.

THERE is no doubt, says the *Birmingham Post*, that a crisis has arisen in the history of Cheltenham, and that the town's position among the leading inland watering-places of the country will depend in no small degree on the decision at which the Town Council will arrive in regard to the improvement committee's scheme for spending 45,000*l.* on municipal buildings and a kursaal. The scheme, which first saw the light at the Council's meeting early in the month, has since then been explained to as many of the inhabitants as have chosen to avail themselves of the twice daily lectures which Dr. Ward-Humphreys (the chairman of the committee) has been giving in the room at present doing duty as a council chamber. As was perhaps inevitable, opinions differ as to the merits of the scheme—some raising objections on one score and others on another. There is, however, a general consensus of opinion favourable to something being done in the direction proposed; and, in default of a better plan, there is reason to believe the Council will adopt that which comes before it with the strong recommendation of the committee. If it does, a striking addition will in a short space of time be added to the attractions of "the garden town of England." The proposal is, briefly, to convert the present Winter Garden—which the town recently acquired for 13,000*l.*, but which cost 20,000*l.* in its construction—into municipal offices and a palmery, and to erect at the north end of the garden a kursaal, replete with all the accommodation for drinking the mineral waters, bathing, entertainment, &c.,

associated with such institutions as continental spas. The municipal offices would occupy the whole of the ground space of the present glasshouse, and in the respect that all the departments of the governing body would be housed on one floor, probably these offices would have no parallel in the country. The council chamber, also on the same level, would be located immediately underneath the dome; it would be an octagonal room amply large for the purpose. The ceiling of the offices and council chamber would form the floor of the palmery, and would mark the commencement of the glass superstructure, which rises higher even than the lofty rooms beneath. To bear this new floor the walls of the Winter Garden will have to be strengthened, and it is intended to case them with Ruabon brick, relieved by terra-cotta mouldings. Other architectural improvements will be effected to render the building of a more attractive appearance than at present. The kursaal will also be of red brick, and its principal entrance will be facing the promenade and close to the Queen's Hotel. The lounges, reading-rooms, &c., will be separated from the baths by a circular-shaped room capable of holding 500 persons, and which will be used for concerts, &c., and while there will be no communication between the kursaal and the municipal offices, visitors to the former will be able by an easy gradient to ascend into the palmery. The chief rooms of the kursaal will also overlook the grounds of the Winter Garden, which it is proposed to lay out in ornamental style. The scheme has certainly much to commend it, and for what it will do the estimated outlay is reasonable. The chief objection seems to be to the location of the municipal offices in the promenade; but as a matter of fact, although the building faces that thoroughfare, there will be no entrance from the promenade to the offices. There are of course those who object to the expenditure of so large a sum as 45,000*l.* on a scheme of this character, but the obvious answer is that, so far as the one part of the scheme is concerned, suitable municipal buildings (which are absolutely necessary) could not be erected elsewhere at anything approaching the sum now proposed to be devoted to that purpose, and that, as regards the other part of the scheme, if the Spa is to be revived at all, it is worth doing the thing well while the Council are about it. The Prince of Wales is expected to visit Cheltenham in May in connection with the annual review of the Gloucestershire Yeomanry, and it is hoped His Royal Highness may be induced to take part in the inauguration of this scheme, which is fraught with much promise for the future of the town.

## PROPOSED BUILDING TRADE EXCHANGE IN EDINBURGH.

As a strong desire has been said to exist among parties connected with the building trades throughout Edinburgh and district that an exchange should be instituted on somewhat similar lines to the Glasgow one, a meeting of all parties interested was held on the 13th inst. in Dowell's Rooms, George Street, Edinburgh. Councillor Hunter occupied the chair and about 200 gentlemen were present, the gathering being of a most representative character. After some preliminary remarks from the Chairman, Colonel Bennett, Glasgow, who was largely instrumental in inaugurating the exchange there, gave his experiences of that institution and also of those in America which he had visited. He said they in Glasgow had found it advisable to take a lesson from their brethren in America. What they had done in Glasgow had proved the probability of the existence of these exchanges in this country. The general principle was a simple one. The builders believed that a more intimate social relation and acquaintance with each other would tend to check the bitterness of rivalry and keep the eagerness of competition within reasonable limits. Further, it was believed that the skill and knowledge of each member would be secured by all and their usefulness to the community increased. Such exchanges had been instituted in nearly every one of the larger cities of the United States and their utility demonstrated. In America the builders were nearly fifty years in advance of those in Britain. The principles of the exchange were adhered to in the offices of the leading architects and surveyors. An exchange based upon proper lines, and which was strong and associated for the common

good of all, would mean that the competent men would come to the front and the laggard would go to the wall. The exchange would also mean the putting an end to shoddy work and shoddy prices. In Glasgow during the last two years they had formed themselves into a limited liability company and they were perfectly solvent. They had found favour with many of the architects and surveyors. In fact, they found benefits daily. In Glasgow they had pointed out the fallacies of the new City Improvement Bill. Further, as business men they objected to the grocer, baker and candlestick-maker, who were their city rulers, tackling business which they knew nothing about. They objected to faddists. Mr. Cook, secretary of the Glasgow Building Trades Exchange, also addressed the meeting, explaining the inner working of his institution. Their membership in Glasgow was about 300. They had found a firm footing, and were now in a really prosperous condition. In reply to a question, he stated that at the close of the first year the Glasgow Exchange had a surplus of 50*l.*, and at the close of the second year 200*l.* Councillor Yooll, Leith, moved the Building Exchange be formed for Edinburgh and Leith. Mr. Peter White, in seconding the motion, said the members of the building trade desired to protect themselves in a proper business fashion. They did not want the Town Council or any other body to teach them. In Edinburgh the builders were just cutting each others' throats, whereas in Glasgow they had succeeded in abolishing a great deal of unnecessary competition. The motion was unanimously adopted. The chairman, in referring to the memorandum and articles of the proposed limited liability company, stated that between 700 and 800 shares had already been applied for. Mr. John Laird, valuator, Glasgow, stated that in Glasgow recently a set of schedules went out from the Glasgow Corporation which were found to be not in conformity with what the building Exchange considered to be a proper form of contract. It was ascertained to whom schedules had been sent. A notice was sent to these gentlemen, who happened to be members of the exchange, to return their schedules to the secretary. The schedules were all returned, and were put into a large envelope and sent back to the wealthy Corporation, with instructions that no one would offer unless the contract was altered. The result was that the contract was altered and put into a form which was just to the contractor and to the builder. A committee was afterwards appointed to forward the formation of the exchange, and a cordial vote of thanks was awarded to the delegates from Glasgow.

### PROPOSED EMBANKMENT AT ASSUAN.

At a meeting of the Victoria Institute on Monday, Professor E. Hull, F.R.S., described the last proposed and most generally approved scheme for embanking the waters of the Nile at Assuan, in Upper Egypt. After referring to the long lapse of time during which the cultivation of the ground in Egypt had been carried on by irrigation, and having described the origin of the rise and fall of the Nile and the source of the fertilising sediment, the author proceeded to deal with the question of the proposed embankment of the Nile waters at the first cataract, by which, during the period of Low Nile, the waters would accumulate to the extent of allowing a second flood by means of distributing canals carried down the valley on each side of the river. He also gave an historical sketch of the various projects proposed by Linant de Bellefonds, Count de la Motte and Mr. Prompt, and the final adoption of the Assuan site on the report of Mr. W. Willcocks, director-general of reservoirs, together with the arrangement by which the Island of Philæ with its monuments would be preserved from injury

bridge was 77 feet in length. The new bridge, 84 feet 9 inches in length, had been erected beside the old one, complete even to the rails and its final coat of paint. This had already been provided with temporary wheels in the same way. The preliminary part of the work—the raising of the old bridge and placing it on wheels—was the most arduous part of the task, and occupied the men incessantly until a quarter to seven. Then, by means of powerful crabs and winches attached to the new bridge, this was slowly pulled into the place of the old, the latter being at the same time pushed out of the way. It was a dead weight to move of 250 tons, but it was accomplished in an hour. At a quarter to eight the new bridge was in its place, and the old bridge was by its side. The next thing to be done was to remove the trolleys or wheeled carriages from under the new bridge and lower it into its final position flush with the permanent way. The completing of this occupied the remainder of the morning, and then the levelling-up and adjustment was gone on with; but at 2.20 the engineer's train was able to cross the new bridge, and the work was practically completed.

### AN ENGINEERING FEAT.

THE Great Eastern Railway Company, which has been doing some great feats of late in replacing some of their bridges which span rivers in a single night, beat its own record on the night of the 16th inst., when, in spite of a severe snowstorm, the bridge over the River Lea, to the south of Tottenham Station, on the main line, was replaced by a new bridge, the old one being removed and the new one placed *in situ* in nine hours. The old bridge was removed and the new one put in its place by the same process and at the same time. Mr. Wilson, the chief engineer, with a large body of officials, and gangs of men to the number of seventy, were on the bridge soon after twelve o'clock with a huge crane, several land crabs, a couple of 100-ton jacks and several 50-ton jacks in reserve. At 12.35 A.M. operations were commenced. The first thing to do was to strip the rails from the old bridge, taking up the plank-ing as well as the permanent way in order that the lifting apparatus could be attached to the girders to raise the whole bridge bodily to the extent of 18 inches. This was to allow of movable trolleys or carriages to be placed underneath resting on transverse girders, which had been erected so that the bridge, being elevated on wheels, could be drawn away. The old

### A PRACTICAL TEST IN COURT.

AN action was tried before Deputy Judge Sills and a jury, at Southwark County Court, on the 19th inst., in which George William Stock, a bricklayer, sought to recover 100% under the Employers' Liability Act from Messrs. Edwards & Medway, builders, Kennington Cross, as compensation for personal injuries. Mr. Kemp was counsel for the plaintiff, and Mr. David for the defendants. On July 13 the plaintiff was at work at the Red Cross Tavern, Paternoster Square, the ground floor of which was not boarded. A plank was laid across the joists for the use of the workmen, but when the plaintiff was walking upon the plank it broke and he fell into the cellar. It was said that the board was weak and rotten. The plaintiff was cut and bruised, his ankles were sprained, his right elbow dislocated and he was still incapable of doing work. The defence was that the board was quite suitable for the work, and that the plaintiff must have jumped heavily upon it. In order to show the condition of the board, counsel for the defendants invited the foreman, a fairly heavy man, to jump upon the half produced in court. This the man did, and to the astonishment of many in court the board snapped in two. The result was received with cheering. The jury found a verdict for the plaintiff, damages 60%, and judgment was given accordingly.

**CABINET-MAKING IN IRELAND.**

A LECTURE was delivered on the 12th inst. by Lord Mayo on "Cabinet-Making in Ireland," at the Mansion House, Dublin, under the auspices of the Irish Industrial League.

His Lordship said the cabinet-making trade of Ireland, he regretted to say, had declined. It had been declining for the last fifty years or more. In seeking the causes that had brought about the collapse of what had once been an important industry in Ireland, they would find first of all that it was cheap transit and free trade. This had the effect of causing inferior goods to be run into Ireland from countries where labour was cheaper. In the second place, machinery was bringing about the enormous developments that had taken place in the making of mouldings, &c., by steam power. A third cause was the loss of income the gentry had to endure, that was to say, the land-owning class, and which was not confined to Ireland only. This class used to buy fine pieces of furniture; they could not do so any longer. He was not going to descant upon the woes and wrongs of the cabinet-making trade of Ireland, but to look boldly at the present state of affairs, and seek a means of combating the circumstances that militated against this trade. Competition in all trades was immense, and this trade had felt it keenly—perhaps more keenly than others. Fifty years ago furniture was of the heaviest description. This stuff was now cut up to make old Chippendale furniture, for the mahogany was well seasoned and the colour darkened by age. On reference to "Thom's Directory" he found there were at the present time in Dublin fifteen cabinet-making firms, and the number of workmen employed was about 160. Fifty years ago 1,000 to 1,400 workmen were employed. It was lately stated to a deputation to the Board of Works that the cabinet-making trade consisted now of joinery, workshop and office fittings, and the restoration of antique furniture—that is to say, the furniture of the last century. The present public taste ran in that direction; no doubt to some extent that statement was true, and considering the depression in trade that began in the eighties, and from which they were only just now recovering, it was wonderful that a trade like cabinet-making had survived in Dublin and in Ireland. They found, however, that the cabinet-work was done in Dublin, and that carpenter's furniture was made in Ireland, and that fittings for ships' cabins were carried out on a large scale. The schools of carving in Ireland did sound work. With reference to the decline in the cabinet-making trade in Ireland, he said in the other countries systems

of technical education were in existence. They in Ireland were attempting to compete with countries where the workman and the employer were taught at a cheap rate the trade from youth upwards. Drawing with a pencil was absolutely necessary to every modern workman. He had to say with regret that the rising generation in Ireland were, as a rule, going in for professional education to fit them for clerkships in Government offices, railway companies, breweries, distilleries, &c., and that to work with the hands was considered neither dignified nor becoming. To those who were workers in the room, he said whatever they took in hand they should do it well. If they scamped their work it must be found out in the long run, and they would never rise in their profession, and the dignity of labour would never be known to them. Good steady men of every trade commanded good and certain wages; the unstable and idle went to the wall. There was a revival of trade in Ireland, and he begged of them to try and work more and dwell less on wrongs, imaginary or otherwise, and remember that if they wanted help in the way of designs and working drawings, they would be furnished to them. If what he said to-night may be remembered even until to-morrow evening he should have done something to encourage the cabinet-makers and the cabinet-making trade of Ireland.

**NEW THEATRE FOR LEEDS.**

A NEW theatre is to be erected on the south side of the river, on a site containing 1,520 square yards, at the junction of Jack Lane and Meadow Road. The new theatre, which is to be called the "Victoria," has been designed by Mr. William Smelt, architect, Newcastle, assisted by Mr. F. W. Rhodes, architect, Upper Wortley. The design is Classic, and it is proposed that the front of the building should be of red Ruabon bricks, relieved by stone and terra-cotta dressings. The front is on a curve, which is broken up into sections by pilasters with ornamental bases and caps. There will be four shops each 14 feet 6 inches in height. Seating accommodation will be provided for upwards of 3,200 persons. The pit, which will be 60 feet by 76 feet, will seat 1,300, and in the stalls there will be accommodation for 130. In the circle there will be seats for 480, and the gallery will seat the same number of persons as the pit. There will also be six stage boxes. From

the pit three exits will be constructed, on a level with and leading directly into the street. The gallery will have two exits. The circle will be approached by a marble staircase, at the top of which there will be a large crush-room. Behind the circle a refreshment saloon will be found, 28 feet by 18 feet and 15 feet in height. Ladies and gentlemen's cloak-rooms will also be provided. In connection with the pit there will be another refreshment saloon, 28 feet by 19 feet and 15 feet in height. The stage portion of the building will be 62 feet by 36 feet and 48 feet to the grid. The proscenium front will be 32 feet wide and 31 feet high. The stage will be separated from the auditorium by a fireproof curtain, and it is intended that the building should be thoroughly fireproof. The estimated cost is about 15,000/.

### INSTITUTION OF ELECTRICAL ENGINEERS.

A GENERAL meeting of the Institution of Electrical Engineers was held on the 14th inst., when Dr. Hopkinson, the retiring president, vacated the chair in favour of Sir Henry Mance, C.I.E., the new president.

Sir Henry Mance delivered the inaugural address. He said that the volumes of the proceedings of the Institution formed a record of twenty-five years of useful work. During that period the nominal roll of the Society had increased from 100 to nearly 3,000. Founded originally by electricians and telegraph men, it had adapted itself to modern requirements and was now the oldest and largest institution of electrical engineers in the world. It represented all branches of the profession, and would, he trusted, in the future as in the past, aim at including in its ranks the names of all who were interested in and devoted to the development of electrical science. He felt that the only claim he had to the position he now occupied was the fact that for the best part of his life he had been actively connected with submarine telegraphy. Before dealing with submarine telegraphy, however, he wished to refer to certain facts and figures in connection with electric lighting and traction. In the matter of traction we had been outstripped by our transatlantic friends, but there was abundant evidence that this had not been caused by want of knowledge or skill on the part of our engineers or manufacturers; it was, he thought, an acknowledged fact that in excellence of design and workmanship our manufacturers could not be beaten. Our electric-light stations were unsurpassed in the excellence and efficiency

of their plant, electrical and mechanical, and unequalled in their suitability to the end in view. The best features of the methods preferred by us were all of home growth, and if we had to borrow from American practice in connection with the electric traction movement, we should at least be able to point to our tunnel railways as unique, and to the Liverpool overhead railway as the first elevated electric railway in the world. We were now beginning to reap the benefits of the Electric Lighting Act of 1888, both in the number of towns seeking powers for electric lighting and also in the extensions required for those already in existence, the magnitude of these latter promising to exceed that of the original scheme. It was satisfactory to note that manufacturers were turning their attention to the development of cells especially suitable for traction purposes; the advantages already claimed were that for any fixed output the rate was reduced in the ratio of 28 to 15, and the space occupied reduced from 19 to 10. Should these expectations be fulfilled there was every reason to anticipate an extensive use of storage batteries. Dealing with the subject of submarine telegraphy, he said that the earliest record of a subaqueous line was that of the experiment made by Baron Schilling, who, in 1812, exploded mines across the river Neva, using wire insulated with india-rubber. The earliest record at Somerset House of any submarine telegraph company was dated June 16, 1846, when Jacob Brett and Alexander Prince obtained a renewal of their provisional certificate of registration for the General Submarine and Oceanic Telegraph Company. The first concession connected with international submarine telegraphy was also granted to Jacob Brett in 1847, so that this year we might fairly be said to be celebrating the jubilee of the inception of international telegraphy. He had come to the conclusion that to no one individual could fairly be granted the credit of the inception and development of the submarine cable; the work had been the work of many. The earlier history of submarine telegraphy was marked by frequent failures; 20,000 miles of cable were laid during the first sixteen years, but over 9,000 knots of that quantity had been abandoned before 1865. The costly experience thus purchased was derived from the failures of a series of weak and light cables, in many of which the insulation was probably defective or insufficient from the first. Although a commercial failure, the first Atlantic cable was a great engineering success, and during its brief existence gave a practical and striking illustration of its value. The president next alluded to the failure of the Red Sea line, contrasting it with the Malta-Tripoli-Benghazi-Alexandria cable laid in 1861, and

POSTAL AND TELEGRAPHIC ADDRESS, "DASHWOOD, WIMBLEDON."

[4]

ILLUSTRATED CATALOGUES ON APPLICATION

mentioned that it was in connection with the construction of a land line through Mesopotamia, and the carrying-out of the cable portion of the line *via* the Persian Gulf, that his associations with submarine telegraphy commenced. Five sailing vessels were employed to convey the cable to the Persian Gulf, and as many as twelve vessels assisted during the work, which would now be easily and rapidly executed by one well-equipped telegraph steamer. Having alluded to the Bohemian character of the life of a submarine telegraph engineer, and to the isolation and uninteresting character of most of the localities chosen for cable stations, the president said that there were to-day more than 1,300 submarine cables in existence, the aggregate length of which could not be less than 162,000 nautical miles. They varied in length from a quarter of a mile to about 2,600 miles. Of these cables about 18,000 knots belonged to the various Governments, while the balance of 144,000 knots, mostly composed of long sections, had been laid by private companies. They represented a total expenditure of about 40 millions sterling, of which probably 75 per cent. had been contributed by English capital. Up to quite recently nearly every telegraph cable of importance had been manufactured in this country, but England could no longer boast of a monopoly in this business. There were now established well-equipped cable works at Calais and a smaller establishment at St. Tropez, on the shores of the Mediterranean. In addition to these there were the Government works at La Seyne, near Toulon. The Italians had cable works at Spezzia; Germany had recently subsidised a direct cable from Emden to Vigo. Our telegraph supremacy might be considered by some as ranking next in importance to the supremacy of our Navy. The sounding apparatus of Lord Kelvin had added immensely to the possibilities of ocean telegraphy; a knowledge of the contour and nature of the bottom of the ocean was of the utmost value to the cable engineer. Some of the faults that occurred in submarine cables were of the most extraordinary character. Lightning, earthquakes, landslips, submarine volcanoes had all to be reckoned with, and the leviathan of the deep had more than once been responsible for an interruption. In order to effect the repairs which were necessary, a fleet of forty-one telegraph ships was maintained, the gross tonnage of the telegraph marine being nearly 60,000. The type of cable now generally adopted for deep water was a great improvement on that used in the earlier deep-sea cables. The cost of repairs was a most serious item in the accounts of a telegraph company, and the repairing of one of the Anglo-American cables was said to have cost on one occasion

95,000*l*. This was probably the most expensive repair on record. Thirty words per minute was a high speed for a writer, and no average signaller could maintain a greater speed with the mirror key for any length of time. The work of the telegraph engineer was in one respect incomplete; it still remained for him to establish a girdle round the earth. When our network of telegraphs was complete, there ought to be little risk of Great Britain being completely isolated from her colonies in time of war. The president next dealt with telephone and fast-speed cables, and reminded the students, in conclusion, of their duty to the institution, and congratulated the junior members upon their choice of a profession, which was not only growing and progressive, but full of interest.

### THE COUNTY COUNCIL WORKS DEPARTMENT.

ON the 13<sup>th</sup> inst. the sittings were resumed of the special committee appointed to inquire into the management and financial position of the Works Department of the London County Council.

The Chairman said it seemed to him of importance that the report of the committee should be considered by the Council before March 31 next, the end of the financial year. It would therefore be necessary for the evidence to be concluded within a month.

Mr. T. Blashill was further examined. He said that with reference to suggestions for the future, everything depended upon the immediate supervision of the men. The authority for dealing with the men should be thoroughly in the hands of the persons in immediate supervision of them, viz. the foremen engaged on the job. He meant that the manager should not hamper the foremen. Those conditions being conceded, he saw no reason why the workmen should not work as well for a corporation as for an individual. He took a more hopeful view in that matter than some did. He had said he considered that the Council would attract the best workmen to its service. The experiment had been tried, but its success was not yet proved. Certainly the circumstances had not been very favourable. He thought the system of direct employment adopted by the Admiralty a reasonable one. The power of the employer to do the work himself was a valuable one. It was a check to the builder, who might otherwise think he had the custom altogether in his hands. The difficulties met with at the inception of the Works Department arose from starting so many things at once

without proper plant or premises, but the great difficulty arose from not getting the amount of work out of the men. That was not an inherent difficulty. Things had been better since then. There had, however, in the past been great waste of time on these jobbing works. That arose from the Council's workmen, so far as he could gather, having a somewhat bigoted adherence to what he might call trade rules. It had been the rule that one workman must take another to a job. He said nothing against that, but when it came to the case of the mere tightening of a joint, and the plumber examined it and then sent for the fitter to carry out the work, the cost was out of all proportion to the work done. No contractor's man who wanted to make a profit for his master would think of doing that. He by no means contemplated the abolition of the Works Department. Under certain conditions which he had stated, he thought it better that there should be such a separate department.

By Mr. Gruning: If work were put out to tender he preferred that there should be a selected list of tenderers.

Mr. H. E. Haward, comptroller to the Council, handed in a statement covering the whole history of the discovery of irregularities in the book-keeping of the Works Department. It stated that the earliest irregular entries which had been traced were apparently made in the books in July 1895. They consisted of two small transfer items of 10*l.* 1*s.* 8*d.* and 18*l.* 12*s.* 5*d.* A few entries were traced in August and several in September. All these would not in the ordinary course have come under audit until about the beginning of October 1895. His suspicions were first aroused as to fictitious entries in June 1896. The total amount of the irregular entries in the accounts of 1895-96 and 1896-97 was 7,229*l.* 11*s.* 10*d.* Of that sum about one-half, comprising items amounting to 3,334*l.* 3*s.* 9*d.* (or, adding general charges, 3,509*l.* 19*s.* 5*d.*), related to the Colney Hatch temporary buildings account. The particular entries that first aroused suspicion were dated March 28 and 31, 1896, but they were not actually inserted in the books until towards the end of May last. They were challenged by him in June. With what he might call the ordinary check of an accountant and without going behind original documents, it would have been difficult, if not impossible, to discover these irregularities. With reference to the fictitious transfers, amounting to 1,892*l.*, it was to be observed that not only were documents fabricated, but that after he had challenged them every effort was made by officials of the Works Department to induce him to pass the entries,

and to prevent further investigation. It would be seen that Horwood's (the travelling time inspector) signature was obtained by Mr. Dyson for the receipt of the materials, and, doubtless with a view to suggest the genuineness of the transaction, Horwood made certain alterations of the figures. As to the high prices at which this transfer was credited, Mr. Dyson explained that the prices were those charged for stock issues, although similar materials had been charged to Colney Hatch at lower prices. After his attention had been drawn to this, he persisted in defending the transfer entries. Moreover, it was only after a prolonged investigation that the manager admitted to him that "an error had been made," and he then gave him an explanation of the "error," which, if his suspicions had not been aroused, might have seemed plausible. With regard to the earlier transfers between certain jobs which were not discovered in the audit, they were for the most part small in amount, and not likely to attract special attention. The most important of them were vouched by the signatures of the manager's chief assistants, and one of them (a transfer for items amounting to 89*l.* 3*s.* 5½*d.*, from Woolwich ferry workshops to Woolwich ferry southern approach, two adjoining jobs, the same foreman being employed on both jobs) was so vouched by the manager himself. The other items, mostly small amounts, were supported by the signatures of foremen, some of which were not genuine. In more than one case he found that the materials were entered in the "Daily Accounts of Materials" as having been received on the job to which the materials purported to have been transferred, although in fact they were not so transferred. The timber credits overpriced, 370*l.* 12*s.* 1*d.*, related to a number of entries spread over the months of April, May and June, 1896. He could express no opinion as to the value of the goods. That rested with the manager. The credits were, as a matter of fact, priced at about the prices ruling for timber issues from the wharf. The new form of transfer-note provided that the cost price of the material should be shown as well as the value on transfer, so that it would be possible, in future, to see that the value of the goods on transfer was not more than the cost price. Even on the cost price questions arose, because it included, as a rule, additions to the original invoice price for cartage, handling, &c. As to timber twice credited in error, 151*l.* 19*s.* 10*d.*, that was altogether an exceptional item and might have been due to an oversight. It represented some timber lying stacked at Colney Hatch, which was taken by the stocktakers as plant in their valuation of March 31. It had been charged to the job as timber, and therefore it was right to

# THE NEW EXPANDED METAL

*Meshes from ½th in. to 6 in. wide. Strands from 24 B.W.G. to ⅜th in. thickness of steel.*

**FOR BUILDING CONSTRUCTION**, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

**FOR SOLID PLASTER PARTITIONS**, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

**FOR FIREPROOF LATHING**, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

**FOR CONCRETE FLOORS WITH EXPANDED METAL**.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

**FOR EXTERIOR WALLS OF BUILDINGS**.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

**FOR FENCING, TREE GUARDS, WINDOW GUARDS**, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

**ORNAMENTAL. STRONG. CHEAP.**

**OTHER USES FOR EXPANDED METAL**.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away. Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

**BRASS, ALUMINIUM**, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

**CATALOGUES AND PRICE LISTS** can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

credit the job and debit plant account when the parcel was taken into the valuation. Some weeks after, when the timber was actually sent away from Colney Hatch to Bexley, it was entered upon transfer tickets in the usual way, and credits were again passed into the books and thus credited to Colney Hatch a second time. With reference to timber drawn from the docks and not charged, 418*l.* 2*s.* 5*d.*, that represented a series of transactions in the months of March, April and May. On abstracting from the timber stock-book all the timber drawn from the docks for Colney Hatch, he discovered that thirty-nine dock delivery notes, from which entries should have been made in the timber journal, were missing. Upon their production being demanded it was stated that they could not be found. They were subsequently handed to him, having been, he was informed, locked up in an official's desk, and wilfully suppressed. It was then found that they had not been entered in the timber journal, and consequently timber account had not been credited and Colney Hatch had not been debited. As to invoices wrongly appropriated to other jobs, 443*l.* 7*s.* 9*d.*, that irregularity had been practised in the case of one or two jobs besides that of Colney Hatch. All invoices before being passed for payment were appropriated by the Works Department either to some job or stock account, and this appropriation was indicated by means of a rubber stamp, there being a separate stamp for each job. These appropriations were examined by him, and if there was nothing on the face of the documents which raised any question, they were accepted. On many invoices merchants did not state where the goods were actually delivered, and this was the case as regards the invoices which were wrongly appropriated, so that it was not possible from the merchant's entries on the documents to check the rubber stamp appropriations indicating the accounts to which they should be appropriated and charged. In some cases be found that the lower part of the invoices, where the merchant had probably stated the place of delivery, was neatly torn off, so that this means of checking the appropriation was lost. In consequence of the irregularities discovered he was continuing to check the appropriation of the invoices by a system which, in the ordinary course, he would not have felt called upon to adopt. From these facts the committee would see that documents were in some cases fabricated and in others tampered with, that there was collusion between various officials of the Works Department, and that it was only by questioning and testing original vouched documents that the improper entries were discovered. Speaking generally with reference to

the accounts of the Works Department and the way in which they had been kept, he stated that the whole subject had been one of great difficulty. Builders' cost accounts necessarily involved questions of a highly technical and intricate character. The difficulties inherent in any such system of accounts were much increased during the first two years of the existence of the Works Department owing to inadequate staff, want of organisation and the condition of the premises at Belvedere Road.

In reply to the Chairman, Mr. Haward said the malpractices that led to this inquiry involved no pecuniary loss whatever to the Council. If there had been pecuniary fraud on the part of those officers who had been dismissed from the service of the Council it would have perhaps been easier for him to detect the malpractices. The regulations were now being revised under the works committee, and it has been found possible to strengthen them in several respects. He did not think it possible for the whole of the bookkeeping of the Department to be placed under independent supervision.

In answer to Mr. Gruning, Mr. Haward said that owing to the existence of the Works Department a larger amount of account-keeping had, of course, become necessary. The cost of the bookkeeping was, however, part of the expenditure of the works committee, and as such was accounted for in the cost of their works. The capital charged to the department was 175,000*l.*, and the turnover for the year was practically 240,000*l.* He could not express an opinion as to whether that was an excessive amount of capital to employ with the turnover of 240,000*l.* Very little money actually passed through the hands of officials in the Works Department. The only money in bulk was for wages, and every single pay clerk was guaranteed for a larger amount than the amount of his weekly cheque for wages. There was small chance of any loss to the ratepayers by fraud in the Works Department.

Mr. Dickinson: The system we have adopted after a good deal of consideration has been that all cash transactions are conducted by the Comptroller's Department, and not by the Works Department?—That is so; only for the purpose of paying the wages we are obliged to call upon the manager's clerical assistants and pay clerks.

With regard to these malpractices, one of the instances you mentioned was the case of something at the Woolwich Ferry. That was the transfer of certain material from one job to another—a bogus transfer?—It was a composite transfer made up of wages and materials which had been charged in the first

SAVORY & COLES,

Steam Press, Cirencester.

instance to a small job at Woolwich Ferry, and which were subsequently charged to an adjoining job, the two jobs being under the same foreman.

How did you find that out?—I should never have found it out had it not been for this special inquiry.

You suggest that the better system would be one under which the accounts of the Works Department should be independent of the manager; you do not suggest that they should be in the hands of the Comptroller's Department?—Not necessarily. I think the man at the head should have a knowledge of accounts, and should be more of a builder's accountant.

Your reason for that opinion is the disclosure of these malpractices?—Certainly, because it has been shown that the manager has been able to instruct the bookkeeper to make these improper entries.

By Dr. Collins: His summary of work done by the Works Department showed that the final estimate of the works had been 383,538*l.*, and the actual cost 377,643*l.* The result of the rectification of the figures after the discovery of the malpractices had been that a greater profit had been shown up to March 31, 1896; but in the whole period there could be no difference, because what had been taken from one job was simply charged to another. There could be no difference in the ultimate result. The irregularities or malpractices did not amount to pecuniary frauds. There had been no loss to the Council in consequence of them, and therefore no personal gain to any of the individuals concerned. The motive which prompted the irregularities seemed to be to make all the jobs come out at a moderate profit, rather than that some should show a profit and others a loss. His suspicion was first aroused as to some irregularity, not from any information he had received from outside, but merely from an examination of the particular entries as they appeared in the books in the normal course of carrying out the regulations. He himself had had a great deal to do with the framing of those regulations. He had visited Liverpool, where there was a very good system of accounts in operation, but he had found that that system could not be employed in anything like its entirety to the accounts of the London County Council Works Department, because the operations of the Department were altogether different from those at Liverpool. The regulations for the account-keeping in the London County Council Works Department placed the Department more in the position of a contractor than was the case at Liverpool.

By Mr. Beachcroft: The Works Department was almost unique in its constitution. His personal relations with the late manager had always been of a friendly character. The business of the department increased very rapidly. He could conceive the work getting so large that it might become necessary to have a separate audit department. No system of check audit in this huge business could prevent malpractices. He had to rely to a large extent on returns made by foremen. He could not go behind those returns. He had every reason to think that they had now reached the bottom of these malpractices. They went very carefully through the accounts in various ways in order to detect anything further, and he had no reason to think that there were any further entries of the kind in question. He thought there were several works now in progress which would come out at a loss. From fifteen to twenty works had been completed, but not yet reported to the Council. He did not know from personal knowledge that the value of the works now in progress and those completed and not reported was 519,000*l.* In providing the central works at Belvedere Road the works committee naturally expected that they would receive a large amount of work from the Council. If, as the result of the present inquiry, the Council decided to limit the operations of the works committee to engineering works, there would be the risk of a loss to the ratepayers from over-provision of workshops and the like at Belvedere Road.

By Dr. Longstaff: With reference to the detection of the irregular proceedings, it had occurred to him in looking at the matter that yellow deal flooring would hardly be used for foundations or as a material for sewers. That had struck him as a very wild transfer of material. There was a greater cost of supervision in the case of work done by a public body than in the case of that done by contractors.

#### THE NEW COUNTY HALL FOR LONDON.

AMONG the several measures which the London County Council intend to bring before Parliament in the coming session, says the *Standard*, is one bearing the title of the London County Buildings Bill, by which the Council are to be empowered to purchase and take certain lands "for the purpose of erecting thereon," in place of the premises now occupied by them, "larger and properly designed buildings and offices." The preamble of the Bill sets forth that the Council

Suitable for Framing or Portfolio. The size of the Plates is 18½ inches by 13½ inches. Numerous Views (Exterior and Interior) and very interesting Details will also be given. These illustrations will be given in addition to the usual Architectural Plates. On receipt of a Postal Order or Cheque for 19*s.* the Paper will be forwarded each week during 1897.

MEM.—If the Plates are found to be creased, they can be made suitable for framing or Portfolio by passing a damp sponge across the creases, and afterwards, when ironed with a warm iron, the marks will disappear.

**BACK NUMBERS MAY BE OBTAINED.**

**P. A. Gilbert Wood, Publisher, 175 Strand, London.**

have no central office or premises adequate for the conduct of their administrative business, and no sufficient accommodation for their officers and staff. It is declared to be impossible to provide at the present premises and in the adjoining buildings the accommodation which is required, and in consequence the business of important departments has to be conducted in such scattered houses as can be procured in different streets. Under such conditions, the administrative work of London is described as being carried on at great inconvenience and cost, and it is pronounced expedient that the Council should be invested with the powers proposed by the Bill. An auxiliary project enters into the preamble, consisting of the opening up of the Mall, so as to make a continuous thoroughfare from St. James's Park to Charing Cross. This undertaking is mentioned as in contemplation by the Commissioners of Works, and certain provisions with respect to it are included among the clauses of the Bill. Estimates have been prepared by the Council as to the amount which they will require for the purposes of the Act which they are now seeking, the sum named being 851,000*l.*

With respect to this statement of the case it is to be observed that the premises occupied by the Council at Spring Gardens consist, in the first place, of the original building erected about the year 1859 by the late Metropolitan Board of Works, and three adjoining houses subsequently leased by the Board. The Council have added several other houses in Spring Gardens, and have extended their occupation to buildings in Cranbourne Street, Craven Street, Whitehall Place and Pall Mall East. Six departments are thus located entirely away from the main structure, as are also some branches of the departments appertaining to the engineer and the architect. Taking into account the estimated rent of the freehold and long leasehold premises in their occupation, the Council calculate that the actual rent at which they stand amounts to 8,845*l.* per annum. It is complained that the present arrangements are both costly and inconvenient, operating to the detriment of the public service. That the official staff are put into very close quarters at Spring Gardens will be apparent to every one who visits the offices, and it can readily be credited that business must be hindered and a considerable amount of time lost when communication has to be maintained between points as much in one case as half a mile from the central station, while in another instance the intervening space is a quarter of a mile. Be the distance more or less, a system composed of detached offices is a bad one, wasteful of time and strength, and also of money. Still there remains a question as to the proper remedy.

Without disputing any of the statements made as to the unsatisfactory nature of existing arrangements, it is necessary to consider whether the plan connected with the County Buildings Bill is of a reasonable and economical character. To get the land involves the displacement of many old-established and valuable businesses, and it will be seen that, while the Bill provides for an outlay of 851,000*l.*, this is exclusive of the building which the Council contemplate erecting, for which the estimate of the architect is 500,000*l.* The cost of acquiring the site was originally estimated at 813,000*l.*, and we may presume that the larger amount named in the Bill is designed to provide a safe margin, though, unfortunately, in such cases the margin of safety is hard to determine.

For the spot which the Council have chosen whereon to build there is much to be said, if we leave out of view its costliness. It is an admirable situation, contiguous to "the finest site in Europe," and for that reason requires the erection of a building which must be costly in its style if it is to be worthy of the place it will occupy. The area of ground, including that whereon the present County Hall stands, will be nearly two acres. Triangular in form, it has an extensive front towards Cockspur Street and Trafalgar Square; while along the south or south-eastern side will run the continuation of the Mall, opening out immediately to the north of Drummond's Bank. Westward, the Cockspur Street frontage of the triangular space extends to Warwick Street, the length being about 500 feet. The line by the side of the new thoroughfare, measured from the southern angle of the present hall to the point opposite Drummond's Bank, will be about 400 feet, and this is further characterised in a report by the establishment committee as constituting "a magnificent frontage." The clearance necessary for the carrying out of the entire plan will involve a considerable change in the neighbouring property. In the centre of the triangle there will probably be a large open space or courtyard.

As already suggested, so commanding and costly a site naturally lends itself to an architectural design of a somewhat ambitious character. So far as the opening up of the Mall is concerned, that could doubtless be accomplished without the aid of the County Council scheme. But the two projects harmonise with each other, and it is stated as having been distinctly ascertained, that the plan for the County Council buildings will be favourably regarded by the Office of Works as affording a desirable adjunct to the new avenue. In the Bill of the County Council, the clause which relates to this

matter provides that "if and when" the Commissioners of Works decide to form a new thoroughfare between St. James's Park and Charing Cross on the southern side of the land proposed to be utilised as a site for the County Buildings, it shall be lawful for the Council to enter into and carry into effect agreements with the Commissioners with respect to the formation of the thoroughfare, and to grant or convey for that purpose any portion of the lands acquired by them, and to effect changes of such lands or any part thereof with the Commissioners. The clause goes on to specify that "the said Commissioners may form a new thoroughfare," commencing in the Mall "opposite the south-eastern corner of Carlton House Terrace, and terminating by a junction with Charing Cross opposite the northern side of Drummond's Bank." Power is therefore given by this clause for the extension of the Mall, so as to form a thoroughfare leading up to Charing Cross.

With respect to the character of the structure which the Council contemplate erecting, assuming that they get the necessary powers, it is declared within the circle of the Council that there is no desire to erect a Municipal Palace. The high-sounding title of "county hall" is dropped, and all we hear of now is limited to the term "buildings" or "offices." The Act to be obtained is simply to be entitled "The London County Offices Act, 1897." But the existing structure at Spring Gardens is called the "County Hall," and it is difficult to see how the more extensive building can be designated by any lesser title. In regard to cost, there is the possibility of a reduction by allowing the ground floor and the basement of the Trafalgar Square frontage to be let for high-class businesses, such as those of banks and insurance and shipping offices. The Council's valuer considers that at a low estimate this arrangement would yield a rent which, if capitalised, would represent a recoupment of "considerably more than one-third of the whole cost of acquisition." This idea has been scouted in some quarters as altogether fatal to the dignity of a great municipal structure. But the expenditure of a sum approaching a million and a half in the establishment of a county hall demands a material set-off, in order to reconcile the scheme to the economical instincts of the ratepayer. It may also be asked whether it would not be possible to let off some portion of the ground floor on the southern side by the new thoroughfare. It will, perhaps, be replied that the Council cannot spare so much room.

Although the title to this Bill speaks of "buildings," and the Act is to have reference to "offices," it will be perceived

that nothing more is to be dealt with at present than the acquisition of "lands," necessarily including the buildings thereon. But it is impossible to separate the question of the site from that of the structure which is to be erected upon it. If the Council get the site, which is itself an excessively costly one, they are bound to build, and the merits of the Bill are directly affected by that which is only included in it by implication. The ratepayers ought to know the cost of the entire project, and it may be that even a million and a half will scarcely suffice.

### PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

#### APPLICATIONS FOR PATENTS.

156. Thomas Pease and Thomas William Hudgell, for "Improvements in kiosks and like structures for advertising and other purposes."

229. Thomas Kemp, for "Improved inspection and sweeping inlets to drain-pipes, bends and junctions."

394. William Henry Hammond and Alfred Pickles, for "Improvements in the method of and in apparatus for automatically injecting fluids into the flush and waste pipes of closets, urinals, baths, sinks and the like."

630. Edward Pratt, for "Improvements in cesspools and other tanks for liquid or semi-liquid materials, and apparatus for emptying such cesspools and tanks."

162. Thomas Jones and John Charles Jones, for "Improvements in sash-window fastener," referred to and described in our Patent No. 12,848, 1894.

224. James Elijah Brindley, for "Improvement in the machinery used in the manufacture of ceramic tiles."

To INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 37 Chancery Lane, London, W.C.

WOOLDALE (YORKS).—Feb. 3.—For erection of schools to accommodate about 270 scholars at Hade Edge. Mr. Joseph Smith, architect, Huddersfield Road, Halmfirth.

DURING the recent storm which raged at Sunderland a large brick chimney was blown down at the yard of the Sunderland Shipbuilding Company, and falling upon the frame-turning shed, a building 90 feet long, caused the entire structure to fall in. Had not the workmen employed inside the building received warning by the loud cracking of the chimney and made hasty escape, loss of life must inevitably have resulted. To add to the confusion, the exposed furnaces set fire to the wreckage, and the fire had to be extinguished by the workmen.

## TENDERS.

### ABERDEEN.

For Erection of a Public School at Chapel of Garioch. Mr. R. G. WILSON, architect, 181A Union Street, Aberdeen.

#### Accepted tenders.

**TRADE NOTES.**

GROVE ACADEMY, which is being erected for the Broughty Ferry School Board from plans prepared by Messrs. James McLaren & Sons, architects, Dundee, is being ventilated by means of Cousland & Mackay's (ventilating engineers, Glasgow), patent direct-acting invisible roof ventilators and their improved air inlet panels, which have been made and supplied by them.

THE Bierley Small-pox Hospital for the county borough of Bradford is being warmed and ventilated by means of Shorland's patent Manchester stoves and Shorland's patent exhaust roof ventilators and special inlet tubes, by Messrs. E. H. Shorland & Brother, of Manchester.

MESSRS. A. & S. COHEN, of 2 Bury Street, St. Mary Axe, London, have recently brought out a new lamp glass or globe,

**MCNEILL'S FELTS** (Roofing, Inodorous, Sarking, Dry Hair, Damp Course, &c.).

**MCNEILL'S SLAG WOOL** (Silicate Cotton), for Fireproofing and Soundproofing.

AS SUPPLIED TO H.M. GOVERNMENT, WAR OFFICE, ADMIRALTY.

*Lists, Samples, and full Particulars free on application to—*

**F. MCNEILL & CO.**, Head Office, Bunhill Row, London, E.C.; Slag Wool Works, Kirkintilloch near Glasgow.

## HIGH-CLASS PLUMBING.

**MESSRS. B. FINCH & CO., Ltd.**, 82 Belvedere Road, Lambeth, S.E., Manufacturing Sanitary Engineers, beg to remind Architects, Surveyors, and Builders that they undertake High-class Plumbing. They are prepared to Estimate on a schedule of prices, and they can refer the profession and others to large Plumbing Contracts recently executed by them both in London and the Provinces, amongst others to the Trocadero Restaurant, Piccadilly Circus. Messrs. FINCH & Co. have in their constant employ a large staff of registered plumbers. Architects and others can rely upon the work being executed with efficiency and despatch.

**Sole Makers of Finch's Siphonic W.C. & Finch's Urinal for Women, &c.**

## AVOID FREEZING OF PIPES, ETC.

Blue Cape Asbestos Covering, the Lightest, most Durable, and most Effective Removable Covering extant, to prevent Freezing of Pipes, Cisterns, &c., &c., in Private Houses and Public Buildings.

Messrs. JOHN BARKER & CO., Limited, Kensington, write to us as follows:—"We have pleasure in stating that the work done by you is entirely to our satisfaction, so much so that we shall have pleasure in becoming your customers whenever opportunity offers. A full list of your specialties will induce business.—We are, &c., &c."

For Samples and Full Particulars apply to

**THE CAPE ASBESTOS COMPANY, LIM.** Head Offices: 8 Minories, London, E.C.

which is certainly a most effective and inexpensive luxury. It is claimed, and we may add rightly, that if used in conjunction with Messrs. Cohen's new globe, the lighting effect of a Welsh-back incandescent mantle will be considerably more than doubled. The same, of course, refers to an ordinary eight-candle power electric lamp also. These patent globes are so made that without taking away from the light in the room a very great increase of light is thrown upon the table or desk underneath.

The Yost Typewriter Company, Limited, are to be congratulated on the continued success of the Yost writing-machine when in competition with other well-known typewriters. Last week they were awarded two gold medals, one at Bristol and the other at Manchester. Fifteen gold medals in a little more than five years is a record of which they may justly be proud.

### VARIETIES.

THE Thornton-Pickard Manufacturing Company have issued a prospectus inviting subscriptions for 60,000 shares of 1/ each, and consisting of 20,000 Five per Cent. Cumulative Preference and 40,000 Ordinary shares. Messrs. Morris, Gregory & Holmes's certificate shows that the net profits for the past three years have been respectively as follows:—2,752/., 6,442/., and 8,343/—and as the vendors, Messrs. J. E. Thornton & Edward Pickard, will remain with the company as managing directors, there is no apparent reason why this satisfactory rate of increase should not be maintained.

THE first ordinary meeting of the Society of Engineers for the year 1897 will be held on Monday, February 1, at the Royal United Service Institution, Whitehall. The president for the past year, Mr. Samuel Herbert Cox, will present the premiums awarded for papers read during the year. The president for the year 1897, Mr. George Maxwell Lawford, will deliver his inaugural address. The chair will be taken at 7.30 P.M. precisely.

ST. GEORGE'S CHURCH, Wolverhampton, which was closed for three months for alterations and repairs, has been reopened.

IN the course of excavating near St. Augustine's Church, South Croydon, the workmen came upon several human skeletons. In the skull of one the teeth were found to be quite perfect.

DURING the storm which prevailed at Darwen on Monday an iron chimney, 45 feet high, which was being erected at

Messrs. Place & Sons' Eccleshill Colliery and Pipe Work Darwen, was struck by lightning and fell with a loud crash into the yard. Fortunately, none of the workmen were near, and the surrounding buildings also escaped injury. The chimney plates were badly smashed.

AN interesting discovery has just been made at Woking by some workmen engaged in excavating earth for the purpose of laying-out a lawn-tennis court. A brick kiln, between 6 feet and 7 feet in diameter, was unearthed, and was found to contain several pieces of pottery which, with the kiln, are believed to date from the Roman period.

### BUILDING AND BUILDERS.

A MEMORIAL HALL and Sunday school have been erected at Sittingbourne in connection with the Baptist Church, at a cost of 1,500/.

THE new school just opened by the Hornsey School Board at Stroud Green has been erected according to the designs of Messrs. Mitchell & Butler, of 16 Finsbury Circus.

THE plate-glass of the roof light of Northwich County Court fell in at noon on the 25th inst. Several barristers had marvellous escapes, and a solicitor's clerk sustained a wound to his head necessitating his removal to a surgery.

PLANS of a new Board school to be erected in Carbrook Street, Paisley, at a cost of 8,000/., and to accommodate 836 pupils, have been passed in Paisley Dean of Guild Court.

THE Unitarian congregation at Kirkcaldy, which since its formation in 1890 has met in a hired hall, has decided to erect a school-chapel at a cost of 1,000/.

### MESSRS. ARNOTT & COMPANY'S NEW PREMISES, DUBLIN.

THE directors of Arnott & Company have not been overcome by the disastrous fire which consumed their premises in Henry Street. In a surprisingly short space of time temporary premises were constructed and opened. The rebuilding of the premises was likewise taken in hand by the directors, and the palatial structure in Henry Street has made such advances in its completion that it will be quite ready for opening at an early date. The architect for the entire works is Mr. George P. Beater. The contractors are Messrs. H. & J. Martin for the general building works; Messrs. Homan & Rogers for

STEAM FACTORIES, 9, 10, 11, 16, & 17 FULLWOOD'S RENTS, W.C.

the fireproof construction; Messrs. Cummins Brothers for the electric installation; Messrs. Waygood for the electric lifts; and Messrs. Haywood & Co. for the patent glazing of roofs.

The front building in Henry Street will have five windows for the show of goods, each over 10 feet wide by about 15 feet high. The main entrance is also in this section. It is under the central tower and will be used as soon as possible. On the completion of this first section the second will at once be commenced. It is the great desire of the directors to have the whole of the front buildings in Henry Street erected, and they hope that this will be an accomplished fact long before the close of the year. The ground floor will have an area of more than 35,000 square feet, and the basement wareroom will be of a still greater area.

The whole of the buildings are of fireproof steel and cement construction. The lifts, three in number, will be worked by electricity, and the heating will be supplied by hot air from furnaces placed in sub-basements. The ventilation is on a combined system of fresh-air inlets at low levels, with electric fans in the lantern roofs, to be used for the extraction of vitiated air.

## THE BUILDERS' MERCHANTS' ASSOCIATION OF LONDON.

THE third annual dinner, preceded by the annual general meeting, over which the president for 1896 (Mr. W. Sankey) presided, was held at the Midland Grand Hotel, St. Pancras, on Thursday, January 21, 1897. At the dinner there were forty members and guests present, who enjoyed the excellent repast provided.

The proceedings following the dinner were opened by the president for 1897, Mr. Clement Braby (who presided), proposing the health of the Queen and the Royal Family, which was heartily responded to. Following that came the toast of "The late president, Mr. W. Sankey, of Hammersmith," which was ably given by Mr. Erith, who commented upon the able manner in which the retiring President had carried out the arduous duties of that office. The late President replied to the toast, thanking those present for the hearty manner in which they had received it, and stated that in his endeavours to further the interest of the Association he had received much benefit and pleasure.

The toast of "The President for 1897" (Mr. Clement Braby)

was entrusted to the care of Mr. E. Montague Edwards, of Messrs. Young & Marten, Stratford, who remarked that an Association of this character needed in its president an experienced, determined and yet diplomatic individual to insure its successful working. It had prospered under the presidency of Messrs. Hughes, Broad and Sankey, and he felt in proposing the toast of the present chairman that the Association possessed in him the qualities necessary for such an important position. He would like to see the good points of the four presidents rolled into one, in order that the Association might materially benefit by the combined wisdom, energy and tact; but as this would be impossible, the next best course to pursue would be for the presidents to act conjointly as one.

Mr. Braby, in replying, said he appreciated the toast, and further said, the very fact of the Association existing, and of these annual dinners being held, giving the merchants an opportunity of meeting in good fellowship, had done, and is still doing, a great deal to further the interests of the trade generally. This Association had during the past year been working in a quiet way, but he felt sure that a very great deal more good work had been carried through than could be represented in black and white on the minute book.

The next toast was that of "The Builders' Merchants' Association and kindred Associations," coupled with the names of Messrs. Hughes and Wragge, proposed by Mr. Dobson (of Messrs. Godson & Dobson), who, in the course of a well-delivered speech, said:—"Since I have been in this building and have had the pleasure of listening to your annual report, and to the remarks that have been made concerning the work of your Association during the past year, I am filled with wonder and astonishment that you could go on so long without someone thinking of starting the Association years before you did. I believe you have done very good work indeed in the past, but I also believe there is far more to be done in the future. If only we can be brought together more often, as we have opportunities for being in an Association like this, I feel sure the result will be most beneficial to all."

Mr. Wragge (of Messrs. Eastwood & Co.) rose amid cheers to reply on behalf of himself and the kindred Associations, and said:—"There may be many Associations kindred to your Association, but the two with which I am personally most concerned are the Brick Masters' Association and the newly-formed Lime Merchants' Association. With regard to the Brick Masters' Association it is pursuing the even tenor of its way. I hear that several merchants belonging to your Associ-

ation are thinking of going into the brick trade, but I may tell them this, it is not such a flourishing business as it is made out to be. I can assure those present that there is no antagonism between the brick masters and merchants. What the former have done they have had to do in self-defence; and I think it is for the merchants to support them in it. It has been said by one speaker to-night that he hoped I should one day preside over this Association as I preside over the Lime Merchants Association. I beg to say that I do not preside over the Lime Merchants' Association, but am identified as its hon. secretary. I am entirely in sympathy with the Builders' Merchants' Association, and give it my support because it has been the means of my becoming acquainted with many merchants whom I only knew before by reputation. I quite agree with Mr. Dobson that the more we are brought together the better it will be for us. With reference to the Lime Merchants' Association, I think it will succeed because it is now so strong that no lime merchant or burner can place himself against it. I thank you very much for the way in which my health was proposed, and to the utmost of my ability I will work with the Builders' Merchants' Association."

Mr. Hughes then rose to reply for the Builders' Merchants' Association, and in the course of some spirited remarks said:—"With perseverance and pluck I believe we shall prove a great success. I dare say some of us remember the Midland Pipe Manufacturers' Association; the pipe manufacturers are now united as a body, and I do not see why we cannot get into touch with them, and as they are more consolidated I think we are in a better position to approach them; all they ask for is a *quid pro quo*. It has been a great pleasure to me to have Mr. Wragge here and to listen to his remarks this evening. We have heard his words, and I think they will have their effect upon all. If we only stick to our guns, by the end of this year I believe we shall be united in association for our mutual benefit, and I hope that when that does come our friend Mr. Wragge will 'boss.'"

Following this toast was that of "The Visitors," proposed by Colonel Sankey, who is one of the oldest merchants in the lime trade in London. Colonel Sankey said in proposing the toast that he was certain the Builders' Merchants' Association would succeed if only there existed combination and honesty of purpose amongst the members.

Mr. Joseph Cook (of Messrs. Freund & Co.) suitably responded for the visitors, and at the same time announced his intention of joining so useful an Association.

Music and songs were interspersed between the toasts.

There were several visitors present, amongst whom was the solicitor of the Association, Mr. Percy Braby.

The proceedings were brought to a close with the National Anthem.

### THE TIMBER TRADES' BENEVOLENT SOCIETY.

A WELL-ATTENDED meeting of the timber trade of the United Kingdom was held on Monday at the hall of the Carpenters' Company, for the purpose of forming a benevolent society for the timber trade in celebration of the Queen's long reign. The chair was taken by Mr. E. J. Morgan, who was supported by Mr. W. L. Foy, Mr. C. Churchill, the Hon. C. Lawrence, Mr. C. Bird, Mr. C. J. Wade, Mr. H. H. Green, Mr. T. Stevenson, Mr. A. Raffety, Mr. G. L. Renton, Mr. W. H. Rider, Mr. B. G. Elliott and Mr. T. Gabriel. The first resolution, pledging the meeting to promote the speedy formation of the Timber Trades' Benevolent Society, was proposed by Mr. C. Bird, who was responsible for the initiation of the movement. Mr. Bird pointed out that the timber trade was one of the few trades that had no benevolent society to help the poorer members of the trade in times of need or distress. The object of the meeting was to remedy that state of affairs, and he was pleased to be able to say that the idea had excited a considerable amount of interest, nearly 3,000*l.* having been already promised, either as donations or annual subscriptions. The proposed charity was to include in its scope the whole of the United Kingdom, and promises of support had been received from many of the largest firms in the provinces. A draft scheme had been drawn up, which, if approved of in principle by the meeting, would be submitted to a committee for consideration. Mr. C. J. Wade seconded the motion, which was carried unanimously. Mr. W. L. Foy was elected as the first president of the Society, Mr. E. J. Morgan was appointed treasurer, and Messrs. Bird and Wade undertook the duties of joint honorary secretaries. A representative committee was appointed to consider the scheme and to report to a general meeting of the subscribers. The proceedings terminated with the usual vote of thanks.

Among the subscriptions and donations received, which amount to 3,617*l.* 6*s.* 0*d.* and 396*l.* 6*s.* 6*d.* respectively, are the following:—Churchill & Sim, 262*l.* 10*s.* (21*l.*); Foy, Morgan & Co., 262*l.* 10*s.* (21*l.*); R. R. Dobell & Co., 262*l.* 10*s.* (21*l.*);

## THE HISTORY OF ARCHITECTURE.

A LECTURE was lately delivered at Richmond (Surrey) by Professor Hulme, of King's College, London, on "Architecture." The subject, he said, covered a vast field. Naturally, architecture was the mother of the arts. In the early days there were no easel pictures, the artist finding scope for his work in the frescoes of the temples, &c. The sculptor, too, worked hand in hand with the architect. Painting and sculpture had not a separate existence in antiquity. He supposed that the simplest types of architecture would be the hut, the cave, and the tent dwelling of nomadic races. The primitive types had left their mark upon the present day. Even now one saw caves which were rock cut. In China the lines of the buildings had that concave scoop so suggestive of the tent. The first pre-occupation of primitive man was to shelter himself, but this earliest idea soon took development. Man was not satisfied with utility alone, but desired beauty. This desire for ornament or decoration was one of the earliest experiences through which man passed. With regard to the divisions of architecture, the first division would naturally be ancient architecture, which would include Greece, Rome, Egypt, Persia and Assyria. Then with the birth of Christianity we came to the Christian styles, while there was another great division—an outlying division—the art of the Hindoos, though, of course, there was really no art of the Hindoo any more than there was an art of Europe, owing to the vast size of India.

Then there were the Chinese and the Mohammedan styles. Again, the Japanese style must not be forgotten, also the Peruvian and Mexican work, which was an entirely different style and had evidently grown up very much without influence from outside. The last division was that of the moderns, who were more or less copyists, which was, perhaps, more or less unavoidable. A point which people did not sufficiently realise nowadays was that architecture was a continuous flowing stream. Some people were apt to regard the different styles as being isolated, but this was not the case—architecture was really one continuous flowing stream. Of course there were what were known as the transitional periods in architecture, which bridged over the intervals separating two distinct types. Art must be thought of as progressive. There was a life history and growth in architecture, the study of which was most interesting. Of the seven wonders of the world in antiquity, no fewer than four were architectural in character. The Pyramids, of course, were the first—the oldest buildings in the world. Another was the Tomb of Mausolus, built by the wife of Mausolus, from which we derived the name mausoleum. Then there were the great Temple of Diana at Ephesus and the Hanging Gardens of Babylon, the latter built by Nebuchadnezzar for his wife, who was a Mede. Architecture, continued the lecturer, had been greatly influenced by war, religion and commerce. Cambyses, in 523 B.C., plundered Thebes, and took away monuments and artists into Persia. Then, again, Egypt was conquered by the Romans. Darius, who had been with Cambyses, built Persepolis. Many of these plundering races were not artistic, but when they saw the art products of other nations they were delighted with them, and wished to see them in their own country. The Arabs of the desert had practically no art, being a nomadic race; but they were struck with the gorgeousness of Damascus and other Eastern cities, and so they pressed the various artists they came across into their service. In turning to the commercial influence the lecturer showed how the Phoenicians were great traders, and although without any particular art bent, they supplied all other nations. They were the first people to sail round Africa and were the first people to describe the gorilla. He mentioned this to show the pluck of these Phoenicians. Then the Etruscans were a very artistic people and they largely influenced art in Italy and Greece. Egypt, however, was the cradle of art. One of the great features of the Egyptian temples was their size. It was difficult to say what was the age of many of the buildings of Egypt, as the

**HEWETSONS,** ARTISTIC FURNISHERS AND HIGH-CLASS DECORATORS, **TOTTENHAM COURT ROAD, LONDON.**

rulers had a knack of rubbing out the names of their predecessors which are found on them, and inscribing their own names. One characteristic of the Egyptian buildings was their extreme massiveness. Another feature of their work was its flatness, the effect of which they counteracted by the obelisk. The Egyptian temples grew by accretion; they began in a small way, and each monarch added hall after hall, and thus many of them had an irregular shape. Another feature of Egyptian art was the colouring. Then great use was made of the plants of the land, many of them being introduced as symbols. The Assyrian work was very similar to that of Egypt, but the details were much more elaborate; it lacked, however, the grandeur of the Egyptian. The Ionic was a Greek refinement on the Assyrian in the same way that the Doric was a refinement upon the Egyptian. We heard of the proto-Doric, but he thought this was simply an accidental form. With regard to the art of Rome, it was never indigenous; the Romans simply borrowed from their neighbours. They were a grand people in their way, but they were not an art people. They did, however, build noble aqueducts and temples, but the work, after all, was not of a refined character. When the Roman Empire broke up into two empires, one with its capital in Constantinople and the other in Rome, the Byzantine art was developed in the Eastern empire. It was more original than the art of Rome and much richer in colouring. The lecturer then passed on to show the effects on art of the rise and spread of Christianity, and by means of copious blackboard illustrations showed the chief characteristics of the Gothic, Norman, Early English, Decorative, the Perpendicular. In bringing his lecture to a close with a hurried reference to the moderns, the lecturer said that in modern architecture we had a bit of everything; there was no special style.

#### THE CHELTENHAM SPA SCHEME.

THE Cheltenham Town Council held a special meeting on the 22nd inst. to consider the improvement committee's scheme for converting the Winter Garden into municipal offices and a palmery, and the erection of a kursaal on the south end of the site at an estimated cost of 45,000*l.* The mayor (Alderman Colonel Rogers) presided.

Alderman Lawrence referred to the criticisms passed on the committee's scheme, and brought forward a suggestion by one of Cheltenham's most prominent citizens to the effect that the present Winter Garden structure should be pulled down, that

on its site a kursaal should be erected, and that on the piece of ground alongside the New Club (at the spot where it was proposed to make the entrance to the municipal buildings under the committee's scheme) should be erected new municipal offices, which would have no connection whatever with the kursaal. Other suggestions had been made, such as the purchase and utilisation of the assembly-rooms for the purposes of municipal buildings, at an estimated outlay of 30,000*l.*; the purchase of the houses adjacent to the public library unused site, and the erection of offices at a total cost of 26,000*l.*; or the utilisation of the site of the old post office in Clarence Street, at a cost of 20,000*l.* or 30,000*l.*, and it would be well that the committee should have an opportunity of considering these suggestions. The elevation of the kursaal according to the committee's scheme was not considered by many to be a desirable one, and if the kursaal were put on the site of the Winter Garden, or a little further back, the prominent characteristics of the scheme could still be retained. He proposed that before the Council came to a final decision on the recommendation of the committee, they (the committee) be asked to submit an alternate plan and elevation, with an approximate estimate of the cost, for an entirely new building on the site of the present Winter Garden, to provide, as far as possible, similar accommodation to that offered by the committee's plan. Mr. Skillicorne seconded this proposition.

A lengthy discussion ensued, in the course of which Mr. Margrett argued that the cost of carrying out the committee's scheme would involve an addition to the rates of 9*d.* in the pound.

This was ridiculed by Major Griffith and others, who contended that the improvements on which money had already been spent had proved of great advantage to the town, and that the prospects of enhancing the prosperity of the town by some such scheme as that proposed were most hopeful.

In the end, Alderman Lawrence's amendment was accepted by the committee, and agreed to *nem. con.*

of the living. The church, which was built about 1200, was a large plain structure, partly in the Norman style, with later additions, and had a tower surmounted by a low spire. The church has been the burial-place of the Cavendish family since 1618, a chapel and vault having been added to the church in that year within the chancel, and this is the only portion of the building saved. In it are two costly monuments—one to Sir Charles Cavendish, who died in 1617, and to his lady, and another to the memory of Henry Cavendish, Duke of Newcastle. The fire was discovered about three o'clock in the morning. The heavily-timbered roof was then in full blaze. There was plenty of evidence to show that the outburst originated in the vestry, situated at the north-east end of the building, and directly over the heating apparatus, where towards midnight on Saturday the verger banked his fires for the night. Adjoining the vestry was the organ chamber, and when this caught the flames would easily be conveyed to the roof, which had all fallen in by four o'clock. The lead on the roof melted and spurted all over the walls, so that the charred remains of what was the south aisle are all sprayed with lead in small particles. What made the matter worse was that the supply pipe to the gas meter melted, and the flames were further assisted by the escape of gas, which swept everything before it. A stained-glass window, presented by Mrs. Charlesworth, was destroyed to the last fragment, much of it being melted by the intense heat. No sign is left of the organ and pulpit, nor of a handsome carved oak screen. The brass lectern, presented to the church by the late Rev. Brabazon Hallows, was burnt almost beyond recognition. The pillars, which were of limestone, were eaten away almost completely by the flames, and not a sign of the seating remained after five o'clock. All the mouldings throughout are destroyed; the windows and the carvings are completely ruined, and several important memorial tablets are in ruins. An ancient piece of sculpture, which was found about 165 years ago, and placed in the south aisle, has, though not in the midst of the flames, been much cracked, but it is hoped that it can be restored. At about a quarter to five o'clock the flames found their way into the tower, where the oak beams and the case of the clock, which faced in two directions, were soon in a great blaze, lighting up the surrounding country. At 5 o'clock the bells chimed out as usual, and, as the awe-stricken spectators waited to hear the clock strike for the last time, three of the bells fell to the ground with a tremendous crash, and the clock then gave way. A messenger had been despatched to Welbeck Abbey to call up the fire

brigade. He arrived at Welbeck about 7 o'clock, and the new steam fire engine was despatched, arriving about 8 o'clock, but there was little left to be done, the church being then a smouldering mass of ruins. The credit of saving the Cavendish Chapel and the monuments is due to the local people. The Rev. T. C. Hills (the vicar), the Rev. A. B. Maughan (his curate), and a corps of willing workers rendered valuable services, and had practically saved this portion of the edifice before the arrival of the brigade. The building was insured for 3,150*l.*, the amount having been doubled only a few weeks since, but it is estimated that it will cost at least 10,000*l.* to rebuild the church. A committee has already been formed with a view to erecting immediately a temporary iron church.

### NEW GENERAL HOSPITAL, BIRMINGHAM.

PRELIMINARY arrangements for the opening of the new General Hospital were made on Monday at a meeting of the general committee. Her Majesty was unable to add this function to her other engagements, and in these circumstances has deputed Her Royal Highness Princess Christian to open the hospital on her behalf. The expeditious manner in which the work of building the new hospital has hitherto proceeded has, says the *Birmingham Daily Post*, been such as to entirely satisfy expectations. An inspection of the work which we had the opportunity of making fully bears out what was said in this connection, and we fancy that could the citizens generally enjoy a like privilege, the prevailing impression would be one of astonishment that in such a comparatively short space of time the forest of scaffolding should have given place to a majestic pile of buildings, dominated by two handsome towers, flanked on every side by turrets and studded with spirelets. Fortunately the weather has been open till within the last few days, and there has been no suspension of the operations of the large staff of workmen engaged in various departments of the work. At present there are about 400 men employed there, including bricklayers, plasterers, carpenters, plumbers, hot-water and electrical engineers, and craftsmen too numerous to be classified. A number of Italian workmen are busily occupied in laying down the *terrazzo* paving in halls, corridors and other places, this being a class of work demanding the skill and experience of specialists. Then the laying of about 14 miles of wire for electric lighting, and probably nearly half this length for telephonic communication, is no slight task. Again, it is to

for FASCIAS, LANTERNS, LAMPS, and HOUSE SIGNS.

SOLE MAKERS—E. L. BERRY, HARRISON & CO.

Electric Light Engineers, LYRIC CHAMBERS, WHITCOMB STREET, W.C.

be noted that the men actually employed on the site represent only a proportion of the artisans and artificers whose hands and brains are occupied in the work of rearing the immense edifice, as we were reminded in the course of our inspection by not a few inquiries which passed between the clerk of the works (Mr. J. Parsons) and his subordinates as to prospective supplies of materials, arrangements for transit and such-like details, all involving the employment of skilled or unskilled labour. The actual building work which has yet to be done is confined within a very small compass, comprising the completion of the boiler-house and small laundry, the pathological department, the porter's lodge and carriage-shed, and an open cloister, all one-storey buildings. The interior work is also well advanced, and when the days lengthen the progress made will be even more rapid.

First try to realise the magnitude of the site. Its longest frontage is towards Weaman Row, and measures 490 feet; next towards Steelhouse Lane, 340 feet; Loveday Street, 390 feet; Whittall Street, 125 feet; and with the remaining boundaries not abutting upon the streets a total of 1,470 feet, or over a quarter of a mile. The principal entrance is from Steelhouse Lane, under a triple arch, the centre one for carriages, and side ones for foot passengers. To the left is the porter's lodge, to the right a carriage shelter, all designed to harmonise with the architectural features of the main buildings, but subordinate thereto. Flanking this comparatively low building, a dwarf wall and piers, with railing between, surrounds the site, except in Loveday Street, where it has been found necessary to erect a boundary wall. Passing through the archways already mentioned, we find ourselves in a spacious quadrangle, and in front of us a series of arches form an open cloister, which connects, under cover, three entrances to the building. That in the centre is marked by a triangular carriage porch, the outer pier of which is adorned by a group of figures which have been excellently modelled by Mr. J. Wenlock Rollins, a former student of the Birmingham School of Art, who is now making his way to fame as a sculptor in London. On the right-hand side of the quadrangle is another triangular porch with three detached piers, each embellished by a single figure, also by Mr. Rollins. In addition to the artistic value of these figures the idea of the architect has been to convey a poetic meaning. The group of three represents the art of medicine on one side and the science of surgery on the other; and these together hold high the lamp of life, supported by the central figure philanthropy, who is

trampling under foot the serpent, symbolising death. The other three individual figures represent three essentials to health—light, air and purity. The central block of building contains the administrative department, *i.e.* sitting and bedrooms for the resident medical and surgical staff and the house governor in front; dining halls for the staff, the nurses, and the servants in the rear of the main corridor, which runs from about the centre of Loveday Street on one side nearly to Whittall Street on the other. Sleeping-rooms for the servants occupy the upper portion at the back. The whole of the basement is for stores, and the top storey is devoted to the kitchen department, where all cooking is arranged to be done by either steam or gas. In the centre of this department there are two lifts, one of which will be constantly employed for gaining access to the several floor levels, for transferring patients on beds or stretchers when necessary, and for the distribution of meals. Each floor of the hospital is free from steps, so that patients and meals can be readily conveyed from one portion of the building to another with the aid of wheeled trolleys assisted by the lifts. However, we are supposing that the buildings are still being surveyed from the quadrangle, and now note in the gable of the central block the city arms and in the panels below the arms of the counties of Warwick, Stafford and Worcester. The connecting buildings between the central block and the two lofty and massive towers are the main corridors, which form the links between all the pavilions on each floor. Within each of the two large towers there are staircases from the basement to the top floor of the wards, divided from the corridors by doors having check-springs so as to prevent the air ascending from one floor level to another. In the upper portion of the towers are placed large circular steel cisterns, into which water will be pumped from the artesian well near to the boiler-house, and thence distributed throughout the buildings. On a line with the towers and at right angles to the main corridor are the four principal pavilions, giving three storeys of wards at the back and two in front; the ground-floor on the left of the quadrangle being devoted to board and committee-rooms and business offices, and that on the right to the out-patients' department, the entrance to which is under the side triangular porch. It consists of a large waiting hall, lighted by clerestory windows, with a row of columns on either side supporting the walls of the wards above. The columns and surrounding walls will be lined with majolica and faience ware, having a rich brown dado, with ivory white above picked out in blue and green grays. On the entrance side are arranged male

For Extras and Additions, bound as above. 100 forms 3s. 6d.,  
post free, 3s. 9d.; or four for 14s.

"As Certificates and Orders are always liable to be produced  
in law courts, it is well to have them prepared in a way that  
will satisfy judges and jurors as well as clients. It can be  
claimed that the new forms will sustain that sort of test  
successfully."—The Architect, April 26, 1895.

SAVORY & COLES,

Steam Press, Cirencester.

and female surgical and medical consulting-rooms, with retiring-rooms and a splint-store, and on the opposite side are medical and surgical consulting-rooms for ordinary cases, together with special consulting-rooms for gynaecological cases, ear, throat and eye, also with retiring-rooms attached. Two rooms, isolated as regards the transmission of sound to other wards, are provided for noisy patients, and another room is set apart for massage and electric treatment.

We will now continue our inspection around the exterior. Passing the end of the south pavilion we notice the chapel on the first floor adjoining the main corridor. The west end displays a rose window, with seven small windows below, filled with stained-glass, in memory of the late Dr. Bartleet, and one other three-light window is also of stained-glass as a memorial to the late Dr. Jolly. The interior of the chapel, although of very simple design, has a rich appearance, the walls being lined with alabaster, the gift of Mrs. J. C. Holder, the roof being panelled in oak. On the ground floor below the chapel are the matron's and linen-rooms. At the end of the main corridor is another staircase, which gives access to each floor close by the small north-west and south-west pavilions, which, in addition to six associated wards for special cases, including children, provides two operating-rooms, a room specially fitted up for gynaecological cases, single wards and ward kitchens. Opening off the staircase is a large conservatory, which will be used for tending plants to be placed in the wards, and forms a covered way to the nurses' home, which otherwise is an entirely detached building fronting towards Whittall Street. It contains over a hundred separate sleeping-rooms for the nursing staff, as well as sitting, writing and lecture-rooms.

In passing around we see in the centre of the front three panels, containing modelled figures, representing Perseverance, Patience and Prudence, three essential attributes to efficient nursing. They are the work of Mr. J. W. Neatby.

Two detached one-storey buildings at the Weaman Row end of the north-west pavilion are for infectious and septic cases, the symptoms of which now and then develop after a patient has been admitted for some other ailment. Here they can be nursed without danger to the other inmates of the hospital.

Near to the end of the west pavilion there is a stores entrance from Weaman Row, provided with weighbridge and office, and next come the boiler and well-house, small laundry, and disinfecting and destruction chambers, together with a well-proportioned octagonal chimney stack. Beyond is the pathological

department, containing the mortuary, with waiting and viewing-rooms, post-mortem and pathologists' rooms, this building being provided with a gate entrance from Weaman Row for the removal of bodies, without the proceeding being brought into view from the wards. The heating and ventilating appliances for this portion of the building are in a spacious chamber under the lecture theatre, the openings in the walls being provided with shutters for regulating purposes. Then come series of steam coils, and next the large surface of moistened screen, through which the incoming air is filtered. The air then passes through or under hundreds of feet of steam coils, according as the outside temperature demands, and is then forced onwards by rotary air propellers, one over 9 feet in diameter for the east pavilion, and another about 8 feet in diameter for the north pavilion. These are turned by electric motors, and there are six other propellers rather less in diameter for the remaining portions of the building. The heating and ventilating appliances are being provided by Mr. William Key on the plenum system, his contract being to provide for a maximum change of air up to ten times per hour, at a uniform general temperature from 60 to 62 degrees Fahr. winter and summer, with power to raise the temperature of any of the rooms above that of others when desired. The air is propelled along large ducts in the basement, and at the base of the vertical flues by which the air ascends to the several rooms are additional steam-heating coils and regulating valves. No apparatus whatever except the inlets for the cleansed and tempered air and the outlets for same are placed in any habitable portions of the building, yet every ward, room and corridor will receive a constant supply, which in due course passes up the outlet flues into roof ducts, and passes into the open through flapped and louvred turrets, these latter being prominent features on the several roofs.

So far we have failed to direct attention to an important feature situate above the lecture theatre, namely, the large operating theatre. It is in appearance semicircular in form, with windows all round the outer circumference, and partly top-lighted. On the flat side is a students' gallery, approached by outer stairways from the corridors. The floor is laid with terazzo and the walls lined with marble and alabaster, specially treated to make them non-absorbent, while the ceiling is finished in waterproof cement. The smaller operating-rooms are to be treated in similar manner, and a surgical committee has made visits of inspection to several metropolitan and other hospitals, in order to be in a position to select the most

approved modern appliances and fittings. Artificial lighting throughout the buildings will be by electricity, the current being obtained from the mains of the Electric Supply Company, who also have contracted to give a supply for the electric motors. A complete telephone exchange is provided within the buildings. Having now made a circuit of the buildings, we will attempt to convey some little idea of the appearance of the exterior.

The materials employed are a deep-coloured red brick obtained from the neighbourhood of Cradley, with plum-coloured bands and red terra-cotta for the decorative features, the roofs generally being covered with Westmoreland green slates.

The predominating idea in the design is the employment of octagonal forms in the towers, the turrets, the buttresses and the angle and gable terminals, the vertical lines of all these features being counterbalanced by horizontal bandings and panelled work. Although the ornamentation is obtained by simple means and frequent repetition, the general effect is that of richness, held in reserve by frequent plain surfaces, which give a pleasing contrast and prevent the eye being over-satiated by elaboration. All the modelled ornament has been executed under the direction of the architect, Mr. W. Henman, by a staff of modellers employed by Messrs. Doulton, who have manufactured the terra-cotta principally at their works at Rowley Regis. A noticeable peculiarity of the terra-cotta was insisted upon by the committee, on the advice of the architect, viz. that, contrary to popular prejudice, it should have a roughened surface. It is interesting to compare the effect with other red terra-cotta employed in buildings erected in the city. Mr. Henman gave scientific reasons for this departure in terra-cotta manufacture which certainly are justified by the improved appearance and probable durability of the material so treated. Mr. Henman informs us he has frequently been asked what particular style of architecture has been adopted for the buildings, and assures us of his inability to define it. His endeavour has been to adopt the spirit and not the letter of ancient work, to make the buildings a living monument of the time in which we live, using the materials determined upon in a sensible and legitimate manner without despising modern methods of construction. His plan has been to first determine what seemed most appropriate to the requirements of the institution, and then cause the ornamental features to grow naturally out of the construction, or so place them to emphasise particular parts while preserving

the general unity of the scheme. Certainly a critical examination of the building will evidence to any one the care bestowed even upon the minutest detail, and he has, fortunately, imparted to all engaged upon the works that enthusiastic interest which has resulted in each giving of his best in workmanship and material.

### ACETYLENE GAS.\*

(Concluded from page 16, Jan. 15.)

THE gas obtained from the English carbide is very pure, the chief impurity being 2·3 per cent. of sulphuretted hydrogen, due to sulphur in the coke and gypsum in the lime, whilst with many of the continental samples 6·9 per cent. of impurities is by no means uncommon, one of the principal and most dangerous impurities being phosphuretted hydrogen, which is evidently due to the use of phosphatic lime in the manufacture of the carbide, and also traces of siliciuretted hydrogen. So bad is this with some samples that the acetylene produced from one batch obtained from Denmark actually gave a haze when burnt for some time in a small room.

It is manifest that if the carbide is contaminated with calcic phosphide, the action of the water on it must give rise to a certain quantity of spontaneously inflammable liquid phosphuretted hydrogen as well as the gaseous compound, and the liquid condensing during compression or in the storage holder is a very grave source of danger. No lime or coke should be used in the manufacture of carbide which contains more than the smallest trace of phosphates, and if this point is not more carefully attended to than it is at present in some of the continental works, serious accidents are sure to follow, whilst if this be done as is the case in the manufacture of English carbide, no danger from this cause need be apprehended.

Ammonia is also found as a frequent impurity in acetylene, and gives it the power of attacking copper with the formation of an explosive compound.

In the paper which I read before the Society of Arts in January 1895, on acetylene, I pointed out the ease with which

HARRY SOANE, INV.

the acetylene was liberated from the carbide by the action of water, and suggested several forms of apparatus in which such decompositions might be brought about. These suggestions were followed by a rush of would-be inventors upon the Patent Office, the literature of which has been increased to an alarming extent during the past two years by patents, many of which are characterised neither by novelty nor utility, and which, moreover, are in cases fraught with considerable danger. With the further experience which I have gained in the production and properties of this gas, I now see that many of the hints which I threw out in that paper as to the construction of apparatus would be fraught with many drawbacks, as although most of the dangers with which acetylene was then credited have disappeared into thin air, some other totally unexpected ones have taken their place, and most manufacturers of acetylene apparatus being still ignorant of these, a lively time may be expected for those who employ apparatus constructed by people who, possessing a limited mechanical knowledge, know absolutely nothing of the properties of the gas with which they are dealing, and these are certain to give rise to many troubles in use, and so retard the utilisation of this beautiful illuminant.

In the generation of acetylene from calcic carbide, far too little attention is being paid to the high temperature evolved when any considerable quantity of it is brought into contact with water, and the effect which this has upon the gas. Several attempts are being made to introduce automatic machines for the generation of acetylene on the principle of the ordinary "Kipp's" sulphuretted hydrogen apparatus, indeed several of them are only modified copies of this in metal, and the idea of the manufacturers is evidently that the action will cease and the evolution of acetylene be stopped when the pressure of the gas drives the water back from the carbide; but this is not so, as the heat of the action saturates the gas present with water vapour, and, as the apparatus cools, this recondenses on the carbide and produces more gas, whilst the unchanged carbide will decompose the vapour before condensation and even dehydrate the calcic hydrate which was formed on its surface when the water was in contact with it. The result of this is that after the gas has once been made, no automatic arrangement will stop the slow generation of the gas from the carbide in the apparatus.

When the gas is being continually used this does not matter much, as the slowing down of the evolution of the gas is sufficient to allow the consumption to catch up the make; but

when the gas is turned off, if any quantity of carbide be undecomposed, the automatic generator with its small holder becomes an active danger, as it will either "blow" or generate dangerously high pressures.

In any form of generator where the quantity of carbide is large, the heat generated by the action of the water on the material is quite sufficient to polymerise some of the acetylene into tar-like products which will sometimes cause trouble and stoppages in the pipes, whilst in any case the high temperatures cause a large amount of steam to go forward with the gas, and unless special precautions are adopted to prevent it, such as using a sufficiently large holder, some of this is carried forward to the service pipes.

There is no doubt that for the use of the gas in country houses, a holder large enough for the evening's supply should be provided, and the generators not charged with more carbide than is necessary to yield a volume of gas equal to the capacity of the holder.

The dangers of acetylene, of which a good deal have been heard lately, are almost entirely dependent upon the use of impure carbide and improper apparatus. Pure acetylene has now been shown to be less poisonous than ordinary coal gas, and far less so than coal gas enriched with carburetted water gas, whilst the action of the pure dry gas on metals is practically nil.

It is well known that acetylene can be resolved into its constituents by detonation, and the idea has arisen from this fact that acetylene is itself an explosive of great power. This is, however, an error, as it has been clearly shown that when the gas is under ordinary atmospheric pressure, if detonation is started in acetylene by a charge of mercuric fulminate, the explosion only extends a few inches from the detonator, whilst the explosion in acetylene of acetylde of copper is insufficient to set up detonation of the gas under these conditions.

This, however, only applies to acetylene under ordinary pressure, and any attempts to liquify acetylene by the pressure created by the evolution of the gas from calcic carbide is an extremely dangerous operation, as, if the heat of generation be added to the heat evolved during compression, an action akin to detonation is very likely to take place with the resolution of the acetylene into carbon and hydrogen.

Out of the many forms of generator which have been patented in this country and abroad, there are some which, although there is no very startling novelty in construction, yet afford safety in use, and intending users of acetylene apparatus

should make sure that the generators they employ have been examined and certified as safe by some competent authority.

I have pointed out some of the troubles existing in the generation of acetylene on a commercial scale, but given a good form of generator, the trouble which still exists is that there are but few burners at present manufactured which can be relied upon to consume it in such a way as to develop from it its wonderful illuminating power for any great length of time without smoking, and when the burner itself starts smoking it can easily be realised that its capabilities in that way are immense.

For domestic illumination a burner consuming more than 1 cubic foot of the gas per hour would have too intense a light to be practically usable, and I have found it possible to make a burner which, for this consumption, shall emit a light of from thirty-two to thirty-four candles, which is ahead of the duty obtained for the same consumption by any other burners which I have tested; but with all burners, good and bad alike, after a certain period of perfect burning, which may extend to several hundred hours, a time is sure to arrive when the burner commences to smoke, and, as a rule, all that can be done with it is to take it out and put in a fresh one. The cause of this is that in all burners fitted for the consumption of acetylene the holes or slits through which the gas issues have to be excessively fine, and in time the heat of the burner causes the polymerisation of some of the acetylene into liquid hydrocarbons, which, being decomposed in the hole or slit, give rise to a slight carbonaceous deposit and the growth of carbon filaments from the outlet. The carbon filaments can easily be removed when they make their appearance, but the partial stoppage in the fine aperture of the burner itself upsets the balance of the burner and causes smoking.

The fact that burners can be obtained cheaply, which for a limited time gives satisfactory results, enables dealers to sell burners and to declare that no such trouble exists, but the public who are induced to buy will soon discover the facts for themselves.

Acetylene is soluble in water and many other liquids. At ordinary temperature and pressure ten volumes of water will absorb eleven volumes of the gas, but unless the gas be bubbled through the water the absorption is hardly noticeable in the case of an ordinary receiver or gas-holder, as the surface of the water rapidly becomes saturated, and after that the absorption is very slow, whilst when the whole bulk of the water is completely saturated the absorption stops.

The solubility of the gas may also be largely done away with

by dissolving salt in the water surrounding the gas-holder, but this has a destructive action upon the metal of the holder, and it is therefore better to use ordinary water as the liquid over which the gas is collected and stored.

The gas can be condensed to a liquid under a pressure of 21·53 atmospheres, or 323 lbs. at a temperature of 0 deg. C., whilst at ordinary temperatures the pressure necessary to keep it in the liquid state is from 500 to 600 lbs. on the square inch, so that the liquefied gas can readily be stored and transported in steel cylinders of the kind employed for liquid carbon dioxide.

The liquid so produced is mobile and highly refractory, and when sprayed into air the conversion of the liquid into the gaseous condition absorbs so much heat that some of the escaping liquid is converted into a snow-like solid, which takes fire on applying a light to it, and burns until the solid is all converted into gas and consumed.

The possibility of liquefying acetylene at pressures about those at which liquid carbon dioxide is produced so largely enables considerable volumes of gas to be compressed into the liquid state in small wrought-iron or steel cylinders, and in this condition by means of suitable reducing valves and burners of the right construction it may be stored and burnt. The small cylinders can also be arranged in the form of portable lamps, whilst for use in the country, where no gas is available, a large cylinder of the liquid gas placed in an outhouse would supply a country house with light for a very long period.

It is now well recognised that all luminous hydrocarbon flames owe their light-giving properties to fine particles of carbon liberated within the flame by various processes of decomposition, and raised to incandescence partly by the heat of the flame and partly by the heat generated by the same actions which caused the separation of the carbon, and it is to the formation of small traces of acetylene in all hydrocarbon flames that a large amount of their luminosity is due. We should, therefore, expect that acetylene when burnt by itself would be the most brilliant of all gaseous illuminants, an expectation which is fully borne out by the results in practice.

Acetylene gas when burnt gives a flame of intense brilliancy, and owing to its richness it can only be consumed in small burners. Under these conditions it emits a light greater than that given by any other known gas, its illuminating value when properly developed, calculated to a consumption of 5 cubic feet an hour—the average consumption of ordinary coal gas—being no less than 240 candles. It is thus seen that when acetylene

## TO PREVENT CISTERNS AND PIPES FREEZING.

THE UNIVERSAL LAGGING COMPANY, LIMITED,

Supplies an unequalled composition for Coating Cisterns and Pipes, preventing the formation of Ice in Cisterns, and the Bursting of Pipes in Private Houses and Public Buildings; Refrigerators and Refrigerating Sheds. Lining Corrugated Iron and Wooden Buildings, also Boilers (Marine and Stationary). Used by the Admiralty, and the leading Water Works Companies.

is burnt in suitable burners it develops an illuminating value fifteen to twenty times greater than that obtained by the combustion of the same volume of coal gas, so that for all practical illuminating purposes a very small consumption of acetylene, in the burners which practice has shown to be best suited for the purpose, does the illuminating work of a very large volume of coal gas, with the result that the air of the room is but little contaminated with the products of combustion, and the excessive heating of the upper portions of the air is reduced to a minimum.

The following table contrasts the products of combustion evolved from London coal gas when consumed in various forms of burners, and giving an illumination of forty-eight candles, which may be presumed to be the amount of light required in a fair-sized London dining-room, and contrasted with this is the amount of the products of combustion which acetylene would evolve in giving the same amount of light, whilst to make the meaning clearer, I have added the number of adults who would exhale the same amount of carbon dioxide in the same time:—

Burner.	Gas Consumed.	Carbon Dioxide.	Adults.
Flat flame, No. 6 . . .	19.2	10.1	16.8
" " 5 . . .	22.9	12.1	20.0
" " 4 . . .	25.3	13.4	22.3
London Argand . . .	15.0	7.9	13.1
Acetylene . . .	1.25	2.50	4.5

If we obtained the same amount of light from paraffin lamps, the carbon dioxide evolved would be equivalent to 22.5 adults; whilst as far as carbon dioxide goes, you might as well invite 32.7 more guests to dinner as use 48 sperm candles to supply the needed illumination.

It has been said that the danger of an explosion from a leakage of acetylene is far greater than with coal gas. This is, I think, a mistake. Mixtures of air and acetylene are explosive over a slightly wider range than is the case with mixtures of coal gas and air; but it must be remembered that if a leakage were caused by a tap being left on, the largest acetylene burner would probably only pass 1 cubic foot of gas per hour, whilst an ordinary No. 4 or 5 union jet burner would pass 5 to 6 cubic feet of coal gas in the same period of time, and from this cause therefore would be far more dangerous than acetylene, whilst if the leak were from a small crack or a leaky joint in a pipe, the rate at which the gases diffuse out would be dependent upon their specific gravity. Coal gas has a specific gravity

of 0.4 as against 0.9 for acetylene; so that through a crack or fissure of the same size only two volumes of acetylene would escape, whilst three volumes of coal gas would find their way into the air, a difference in rate which would more than cover the slight difference in the limiting proportions of explosion, and very little experiment will clearly prove that acetylene cannot in any way be looked upon as more dangerous to property than coal gas.

The field for acetylene at the present time is simply enormous, as not only is it specially adapted for the lighting of country houses and small villages and towns where no coal-gas supply at present exists, but it will probably in the near future take the place of existing forms of lighting in railway carriages, tramcars, floating buoys, &c., whilst as an auxiliary to the electric light for lighthouses, search-lights and coast defence it will, I believe, be of the greatest possible value.

### MOTOR DUST COLLECTORS.

THE Urban District Council of Chiswick is among the first of local authorities to adopt the steam motor-car for the purposes of the collection of dust and house refuse. Hitherto the Council has followed the course pursued by its predecessor, the Chiswick Local Board, and has let the dust collection to contractors. Under this system the cost has increased yearly, while the work has been very inefficiently performed, complaints being constantly received of the non-removal of dust. At a recent meeting the Council received tenders for dust collection for the year from April 1 next at 2,000*l.* and 1,900*l.* respectively, the latter sum being 460*l.* in excess of the sum for the year ending on March 31 next. Before accepting either of these tenders the Council instructed the surveyor, Mr. Arthur Ramsden, to report as to the saving likely to be effected by the purchase for dust-collecting purposes of a steam motor tip-car, a design for which, prepared by Mr. John I. Thornycroft, had been submitted by the Steam Waggon and Carriage Company, of Chiswick. This could be purchased for 350*l.* The Surveyor reported that if two of the motor-cars were purchased at the price stated, and the payment spread over three years, he estimated that there would be an immediate saving of 50*l.* a year, and that at the end of the three years the saving would be about 250*l.* per annum. The Council has decided to purchase two of the motor-cars on the terms suggested, to be delivered on March 31 next.

## PURE WATER AND CONSTANT SUPPLY. ARTESIAN & "CANADIAN" TUBE WELLS

Are the ONLY SURE SOURCES of PURE WATER.

Pure Water is essential to health and to the successful management of Country Houses, Estates, Farms, Hotels, and Public Institutions.

## LONDON AND GENERAL WATER PURIFYING COMPANY'S, LIMITED,

House Cistern fitted with a Cistern Filter.

PATENT CISTERN FILTERS, Charged Solely with Animal Charcoal. Requiring, when once fixed, NO attention whatever, and superior to any others. Vide Professor Frankland's Reports to the Registrar-General, July 1866, November 1867, and May 1870. The Lancet, January 12, 1867.

Also, Testimonials from Dr. Hassall, September 28, 1868; the late Dr. Letheby, February 15, 1866, and December 1873.

Price, £1 10s. and upwards.

Portable Filters on this System, £1 5s. to £3.

Patronised and used by Her Majesty the Queen at Osborne, by H.R.H. the Prince of Wales at Sandringham, by H.R.H. the Duke of Edinburgh at Eastwell, by H.R.H. the Duke of Connaught at Baginbode Park, by H.R.H. the Duke of Cambridge, the Duke of the Medical Profession, and at the London, Middlesex, St. George's, St. Mary's, Consumption, Fever, and German Hospitals, and various Lunatic Asylums, Institutions, Breweries, &c. and at all the Schools established by the School Board for London. Pocket Filters, 4s. 6d. and 6s. each. Household and Fancy Filters, from 10s. Water-testing Apparatus for detecting impurities in Water 10s. 6d. and 12s. each.

157 STRAND, W.C. (Four Doors from Somerset House), LONDON.

Portable Cistern Filters

## THE MONIER SYSTEM OF CONSTRUCTION.

AT a meeting of students of the Institution of Civil Engineers on the 15th inst. a paper on "The Monier System of Construction" was read by Mr. Walter Beer.

In the brief historical account of the Monier system, with which the paper opened, the author showed how it originated in the attempts of a Parisian florist of that name to obtain large vessels of a material more durable than wood and lighter than concrete.

The principle of the system was stated to be the combination of Portland cement concrete with iron or steel in such a manner as to develop in the same material the high resistance to compression and binding of the former, and the great tensile strength of the latter. It had been found that in such a combination the good qualities of both materials were retained, and no chemical action was found to occur between the iron and the moisture in the concrete. The latter adhered firmly to the smooth surface of the metal, and the co-efficients of expansion of the two constituents were for all practical purposes identical. The economy of the system in the construction of girders and arches was considerable, owing to its great strength and compactness, and further it was absolutely fireproof. Large spans might be used for floors, and the small amount of head-room required was a factor often of great value. Arches of 150 feet or even greater span might be constructed, and the rise need not exceed one-tenth of the span, so that the system could be used in situations where brick and stone would be impossible.

The author dealt with the practical details and cost of the method, stating the particular qualities of materials most advantageously used; and he also entered into a mathematical consideration of the relations existing between the dimensions and quality of the different portions of the structures and the stresses in them under known loads.

The paper concluded with an account of tests to destruction of three Monier arches, with a span of 12 feet and a width of 4 feet. They were composed of three to one concrete, for which crushed granite, coke breeze and crushed brick were respectively used, with a simple netting of 4 inch mesh, formed of  $\frac{3}{8}$ -inch longitudinal rods and  $\frac{1}{4}$ -inch transverse rods, embedded 1 inch above the undersides of the arches. The first arch was loaded uniformly, and after a central deflection of 2 inches, failed when the load reached 11.7 cwt. per square foot. The second was loaded at one side of the centre only, and failed under a load of 4.8 cwt. per square foot, when the deflections at the un-

loaded and loaded sides and centre were respectively 3.16 inch 1.16 inch and  $\frac{1}{8}$  inch. The third arch was also broken by a load on one side only, but withstood a pressure of 7.0 cwt. per square foot.

The paper was accompanied by drawings illustrating several examples of the system, including the arches upon which the author's tests were performed.

## PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

### APPLICATIONS FOR PATENTS.

719. Gustav Mann, for "Improved sanitary covers for water-closet seats."

724. George Crapper and Robert Marr Wharam, for "Improvements in or relating to automatic syphon flushing-tanks."

750. William Woodland, for "An improved sanitary supply cistern."

766. Daniel Thomas Bostel, Frederick James Bostel and Ernest Bostel, for "Improvements in urinals."

801. Alexander John Bates and Thomas Carpenter Dowd, for "Improvements in hanging and other locks."

980. Edmund Edwards, for "Improvements in the surfaces of walls and ceilings to receive plaster without laths or the like."

983. Neville Lynn, for "Improvements in heads or cowls for chimneys, ventilating shafts and the like."

1106. Richard Fletcher, for "Improvements in roofing."

1174. John Merrill, for "Improvements in basins for water-closets."

1187. John Ferguson, for "An improved method or system of fireproofing buildings and the like."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 37 Chancery Lane, London, W.C.

# THE NEW EXPANDED METAL

Meshes from  $\frac{3}{8}$ th in. to 6 in. wide. Strands from 24 B.W.G. to  $\frac{3}{16}$ th in. thickness of steel.

**FOR BUILDING CONSTRUCTION**, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

**FOR SOLID PLASTER PARTITIONS**, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

**FOR FIREPROOF LATHING**, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

**FOR CONCRETE FLOORS WITH EXPANDED METAL**.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

**FOR EXTERIOR WALLS OF BUILDINGS**.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

**FOR FENCING, TREE GUARDS, WINDOW GUARDS**, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

**ORNAMENTAL. STRONG. CHEAP.**

**OTHER USES FOR EXPANDED METAL**.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away.

Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

**BRASS, ALUMINIUM**, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

**CATALOGUES AND PRICE LISTS** can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

**THE EXPANDED METAL COMPANY, LTD.,**

**39 UPPER THAMES STREET, LONDON, E.C.**

Telegraphic Address, "Distend, London."

Works—WEST HARTLEPOOL.

Telephone No. 1829.

## EDITORIAL NOTICES.

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

## NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

*For Advertisement Scale, see page xv.*

## CONTRACTS OPEN.

ABERDARE.—Feb. 11.—For infants' department to the Aberaman Board schools. Mr. T. Roderick, architect, Clifton Street, Aberdare.

ABERDEEN.—Feb. 15.—For additions and alterations at the branch asylum. Mr. G. Taylor, clerk of works, Aberdeen Asylum.

ABERTILLERY.—Feb. 17.—For erection of intermediate school. Messrs. Swash & Bain, architects, 3 Friars' Chambers, Newport.

ARMLEY.—For slating six houses and shop, Armley Ridge Road. Messrs. Fenton Bros., Gipton Wood.

ASHTON-UNDER-LYNE.—Feb. 16.—For erection and extension of workrooms at the workhouse. Mr. B. Seymour, clerk, Stamford Street, Ashton.

BARROWFORD.—Feb. 13.—For erection of a police-station. Mr. H. Littler, 21 Pitt Street, Preston.

BLACKBURN.—Feb. 15.—For erection of shop premises in Simmons Street. Messrs. Simpson & Duckworth, architects, Richmond Chambers, Blackburn.

BRADFORD.—Feb. 8.—For erection of a detached house. Mr. Abm. Sharp, architect, Albany Buildings, Market Street, Bradford.

BROMLEY.—Feb. 8.—For additions to the Board schools at Raglan Road. Mr. Charles Bell, architect, 3 Salters' Hall Court, Cannon Street, E.C.

COCKERMOUTH.—Feb. 20.—For erection and completion of gate lodge and museum in Fitz Park. Mr. Thos. Hodgson, Station Road.

COCKERMOUTH.—Feb. 5.—For alterations to two shops. Messrs. W. G. Scott & Co., architects, Victoria Buildings, Workington.

COLCHESTER.—Feb. 5.—For erection of an infant school in St. Martin's. Mr. C. E. Butcher, architect, 3 Queen Street, Colchester.

CONISTON.—Feb. 6.—For erection of a shop, living-house, &c. Mr. Leake, Sawrey, Windermere.

CORNWALL.—Feb. 13.—For erection of a boys' school at Fowey. Mr. S. Trevail, architect, Lemon Street, Truro.

CORNWALL.—Feb. 14.—For erection of villa residence at Gulval. Mr. Oliver Caldwell, architect, Penzance.

COVENTRY.—Feb. 13.—For erection of a small-pox hospital at Pinley, near the city. Messrs. G. & I. Steane, architects, Little Park Street, Coventry.

COWBRIDGE.—Feb. 8.—For reparation of Llantrithyd parish church, near Cowbridge. Mr. George E. Halliday, architect, 14 High Street, Cardiff.

CROYDON.—Feb. 9.—For erection of an isolation hospital at Beddington Corner, in the parish of Carshalton. Messrs. R. M. Chart & Son, architects, Union Bank Chambers, Croydon.

DERBY.—Feb. 8.—For erection of hide, skin and fat market in the cattle market. Mr. R. J. Harrison, borough engineer, Babington Lane.

DEWSBURY.—Feb. 24.—For erection of hoist and covered way at warehouse, Wellington Road. Messrs. Holtom & Fox, architects, Westgate, Dewsbury.

DURHAM.—Feb. 11.—For erection and completion of twelve workmen's houses in Mitchell Street, and the levelling of site and the erection of boundary-walls, &c., on the Allergate Building Estate. Mr. George Ord, architect, 16 The Avenue, Durham.

ELY.—Feb. 9.—For adapting premises at Ely for use as a Crown post office, &c. The Secretary, H.M. Office of Works, &c., 12 Whitehall Place, London, S.W.

EXETER.—Feb. 16.—For erecting and general fitting-up of the exhibition yard, Mount Pleasant, for the committee of the Exeter Horse Show Society. Mr. W. S. Croote, architect, 93 Paris Street, Exeter.

FALMOUTH.—Feb. 17.—For erection of a boys' school at Wellington Terrace. Mr. Swift, architect, Lemon Street, Truro.

FALMOUTH.—Feb. 22.—For the restoration of Falmouth parish church. Mr. Edmund Sedding, architect, Plymouth.

FARNHAM.—Feb. 13.—For erection of a stone wall and iron fencing for enclosing the frontage of the new ground at the cemetery. Mr. Sidney Stapley, architect, West Street, Farnham.

GLAMORGAN.—Feb. 8.—For reparation of Llantrithyd parish church, near Cowbridge. Mr. George E. Halliday, architect and surveyor, 14 High Street, Cardiff.

GREAT YARMOUTH.—Feb. 13.—For erection of two houses, The Cliffs, Gorleston. Mr. Wm. B. Cockrill, architect and surveyor, Gorleston, Great Yarmouth.

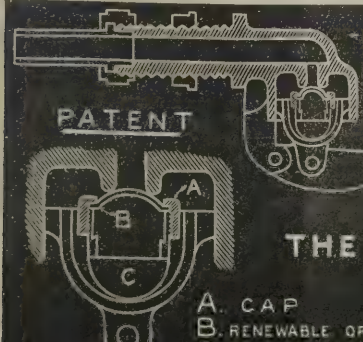

GREENWICH.—Feb. 17.—For construction of an underground public convenience and lavatory at New Cross Gate. Mr. J. Spencer, clerk, 141 Greenwich Road, Greenwich.

HALIFAX.—Feb. 8.—For erection of Ovenden Ward Constitutional Club. Mr. Joseph F. Walsh, architect, L. & Y. Bank Chambers, Halifax.

HALIFAX.—Feb. 15.—For erection of Liberal club. Mr. Medley Hall, architect, 29 Northgate, Halifax.

HARROGATE.—For alterations and additions to the old post office buildings. Mr. T. E. Marshall, architect, Prince's Street, Harrogate.

NEVER - KNOWN - TO - KNOCK -  
WATERHAMMER IMPOSSIBLE  
WITH THE "WATERWITCH" BALL VALVE

PATENT

THE VALVELESS SYPHON CO.  
SANITARY ENGINEERS  
KIRKSTALL, LEEDS.

**HARROGATE.**—For erection of a swimming-bath, Mornington Crescent. Messrs. H. E. & A. Bown, architects, Harrogate.

**HOLBORN.**—Feb. 8.—For construction of an underground convenience. Mr. Henry C. Jones, clerk, 197 High Holborn, W.C.

**HULL.**—Feb. 8.—For repairing, cleaning and renovating Primitive Methodist Chapel. Rev. C. Leafe, 26 Lister Street.

**IPSWICH.**—For alterations and additions to offices, Tower Lane. Mr. John S. Corder, architect, Wimbourne House, Ipswich.

**IRELAND.**—Feb. 27.—For renovation of Faughan Reformed Presbyterian Church. Mr. Wm. Barker, architect, 25 Orchard Street, Londonderry.

**IRELAND.**—Feb. 24.—For erection of a dispensary house and medical officer's residence, for the Guardians of Athy Union. Mr. T. P. Orford, clerk, Board-room, Workhouse, Athy.

**IRELAND.**—Feb. 15.—For erection and completion of a schoolhouse at Meenatale, near Ramelton. Rev. Thomas Slevin, P.P., Ramelton.

**KENDAL.**—Feb. 15.—For pulling-down the old and rebuilding new schools at Selside. Mr. John Hutton, architect and sanitary engineer.

**KINGSTON-ON-THAMES.**—Feb. 8.—For additions and alterations at Clattern House. Mr. Harold A. Windser, town clerk, Clattern House, Kingston-on-Thames.

**KINGSTON-ON-THAMES.**—Feb. 10.—For erection of art and technical schools. Mr. Alfred Boxall, 6 John Street, Adelphi, W.C.

**LEEDS.**—For building Hoffman kiln and other buildings. Mr. F. Rhodes, Upper Wortley, Leeds.

**LEEDS.**—Feb. 10.—For erection of a shaft for passenger lift in municipal buildings. Town Clerk, Town Hall.

**LEEDS.**—Feb. 10.—For alterations necessary for erection of a shaft for passenger lift in the municipal buildings. Town Clerk, Town Hall.

**LIVERPOOL.**—Feb. 9.—For pulling-down and removal of all materials and debris of buildings in North John Street and Princes Street, Liverpool. Mr. J. Francis Doyle, 4 Harrington Street, Liverpool.

**LONDON.**—Feb. 12.—For pulling-down the present board-room, offices, stores, and for erection of iron and glass roof and for paving to extension of the market. Messrs. H. Jarvis & Son, 29 Trinity Square, Southwark.

**LONDON.**—For erection of four shops in South London. Mr. E. Tompkins, architect, Crofton Park, Brockley, S.E.

**MANCHESTER.**—Feb. 5.—For constructing two chimneys and raising the walls, &c., to No. 1 retort-house at Gaythorn Gasworks. Mr. C. Nickson, Gas Department, Town Hall.

**MIDDLETON JUNCTION.**—For rebuilding the Firwood Tavern. Mr. Charles H. Openshaw, architect, Fleet Street, Bury.

**MOGDEN.**—Feb. 26.—For erection of an isolation hospital and other buildings in connection therewith. Mr. W. J. Ancell, architect, 3 Staple Inn, London.

**MORPETH.**—Feb. 12.—For alterations and extensions of the laundry at the County Lunatic Asylum, Morpeth, for the Northumberland County Council. Mr. John Cresswell, county architect, Moot Hall, Newcastle-on-Tyne.

**MOULTON.**—Feb. 8.—For erection of a cookery-room at the Board schools, for the Moulton School Board. Mr. Joseph Cawley, architect.

**NEWPORT.**—March 1.—For erection of pavilion in Newport cattle market. Mr. Benjamin Lawrence, architect, Austin Friars Chambers, Newport, Mon.

**NEW TREDEGAR.**—Feb. 8.—For building three villas. Mr. H. Sketch, architect, New Tredegar.

**OBAN.**—Feb. 5.—For erection of a residence, Isle of Rum. Messrs. Leeming & Leeming, architects, Victoria House, 117 Victoria Street, Westminster, S.W.

**ORPINGTON.**—Feb. 16.—For additions to the Board schools at Chislehurst Road. Mr. George St. Pierre Harris, architect, 8 Ironmonger Lane, E.C.

**OTLEY.**—Feb. 10.—For erection of thirty-two houses in Leeds Road. Messrs. Fairbank & Wall, architects, 3 Manor Square, Otley.

**PONTYPRIDD.**—Feb. 8.—For erection of a church at Carne-town, Abercynon, to seat 500 persons. Mr. George E. Halliday, architect, 14 High Street, Cardiff.

**RAINHILL.**—Feb. 19.—For additions and alterations to wards 10 and 11, main building, county asylum. Mr. Jas. Gornall, acting clerk, Rainhill.

**SCOTLAND.**—For erection of a brick building at Cramond Brig Station. Mr. Aitken, clubmaker, Cramond Brig.

**SHEFFIELD.**—Feb. 13.—For additions to the infants' and girls' departments at Springfield School. Mr. C. J. Innocent, 17 George Street, Sheffield.

## VARIETIES.

EXCELLENT progress is being made with the work of restoration of Canterbury Cathedral, which, it is hoped, will be almost complete in those portions of the cathedral at present under treatment by the time (next July) of the great gathering of Pan-Anglican Bishops in Canterbury.

A NEW Wesleyan chapel has been erected at Airton, a village near Skipton, the site for which and the greater part of the cost (which amounts to 1,200*l.*) has been given by Mr. William Illingworth, of Newfield Hall.

THE Octagon Chapel at Bath, of which Archbishop Magee was for some years the incumbent, has ceased to exist as a place of worship, and is to be converted into a furniture store, all the fittings having been sold by auction.

NEW National schools at Langley Mill, Derbyshire, were opened on Saturday last.

THE Tsar has assigned a sum of 65,000 roubles from the Imperial Treasury for the erection of residential quarters for the female students attending the St. Petersburg Medical Institute for Women. The building will be opened this year.

A BOILER explosion occurred at Mountford & Co.'s engineering works, Manchester. The building in which the boiler stood was demolished. One large piece of boiler was lifted over a tower 80 feet high, and other pieces were found embedded 500 yards away.

THE statue of the Emperor William I. on horseback, with a female figure of Peace leading the steed, has just been removed from the workshop to its destination in Berlin, where it will be formally unveiled on March 22. There is still a considerable amount of work to be done before the statue is completed, and in order to finish it by the date in question operations will be frequently pursued throughout the night by electric light.

WINDSOR CASTLE is to have a museum for the reception of some of its historical relics which, owing to the want of a suitable place for their exhibition, have hitherto been inaccessible to visitors. The place selected for their arrangement is the spacious vestibule between the grand staircase and the Master of the Household's Office. Here the walls are being fitted with handsome oak and plate-glass cabinets, and in these the numerous interesting curios will be displayed.

THE President of the Board of Trade has appointed a committee to inquire into the existing system of ventilation of tunnels on the Metropolitan Railway and report whether any,

and if so what, steps can be taken to add to its efficiency in the interest of the public. The committee will consist of Major F. A. Marindin (chairman), Earl Russell, Sir Douglas Galton, Sir Charles Scotter and Dr. John Scott Haldane. Mr. Robert S. Lendrum, of the Board of Trade, has been appointed to act as secretary to the committee.

THE work of renovation of Ravenfield Church, which was commenced in 1894, has just been satisfactorily completed. The old pews have been replaced by open pitch pine seats and oak choir stalls. An elaborate carved oak reredos, in the centre of which is a valuable old oil painting of the Spanish school, has been added. The walls of the sanctuary have been decorated, and the dome ceiling painted blue and studded with gold stars. A beautiful carved oak pulpit, the open panels being filled in with delicate tracery, and an oak font to correspond, have just been added. All the work has been executed from the designs and under the superintendence of Mr. E. Isle Hubbard, M.S.A., of Rotherham, architect, by Mr. J. Wortley, of Rotherham. Great credit should be given to Mr. Robert Glenn, the contractor's foreman, for the beautiful execution of the work.

CONSIDERABLE alterations are in progress at Waterloo Junction, which will be greatly enlarged and in every way improved, while an overhead access to the South-Western Station will replace the present subway.

MR. W. ADAMS, C.E., has been appointed Manager of the Works Department of the London County Council at a salary of 1,500*l.* per annum.

ARTISANS' dwellings designed to accommodate 1,200 persons are to be erected on part of the land rendered vacant by the demolition of the Millbank Prison.

## TRADE NOTES.

THE new County School, Portmadoc, is being warmed and ventilated throughout by means of Shorland's patent Manchester grates, by Messrs. E. H. Shorland & Brother, of Manchester.

MR. W. CASSELS, Kirkintilloch, near Glasgow, has designed a wash-basin range for schools, factories, public works, &c., for which he claims that it gives the greatest possible facility for rapid and efficient washing, without danger of conveying infection, and economises time, space and water in a greater degree than any other. The time required by school children to wash their hands is, on an average, thirty seconds per scholar, and the amount of water only 1½ pint!

**ELECTRIC NOTES.**

A SERIES of alarming explosions occurred on the Grande Place, Brussels, and in the neighbouring streets on Monday night, causing quite a panic among the inhabitants and doing some damage to property. The explosions were caused by overheating of the underground electric wires, and followed each other with great rapidity and with deafening noise. Paving stones, bricks and tin plates covering the approaches to the wires were thrown several yards into the air.

CROYDON Parish Church was, on Sunday, lighted for the first time by electricity.

**BUILDING AND BUILDERS.**

THE Primitive Methodists have obtained a site opposite the Manchester, Sheffield and Lincolnshire new station, Wigan, for the erection of a hall and schools. The scheme will cost about 2,400*l*.

THE foundation-stone of a Friends' adult school has been laid by the Mayor of Barnsley. The total cost of the building will be 2,000*l*.

**SANITARY ASSOCIATION OF SCOTLAND.**

THE board of examiners of the Sanitary Association of Scotland held their winter examination in the hall of the Faculty of Physicians and Surgeons, 242 St. Vincent Street, Glasgow, on January 27, 1897. The examiners were:—Dr. John C. M'Vail, M.D., D.P.H., Camb.; Dr. Eben Duncan, M.D., C.M.; Mr. Peter Fyfe, F.R.S.E.; Mr. A. B. Allen, C.E.; with Mr. J. C. Stobo, secretary. There were twenty-eight candidates, of whom the following received certificates of competency in sanitary science to discharge the duties of a sanitary inspector, viz.:—Messrs. Robert L. Ashford, Glasgow; Robert J. Taylor, Surrey; Walter R. Nicholl, Perth; John S. Dickson, Perth; David Ronald, Falkirk; James Duncan, Leith; John Gilfeather, Maxwelltown; Alexander Martin, Arran; Andrew Thomas, Glasgow; John Hillis, Lenzie; John Skelly, Duneskin; Kenneth Macdonald, Ayr; William Watson, Arbroath; Alexander Macdougald, Glasgow; William Adam, Paisley; William Rennie, Carlisle; James Robertson, Kilmarnock; John O. Ferguson, Glasgow; David Porter, Glasgow; William Martin, Patna; and Francis Docherty, Glasgow.

**MUNICIPAL OFFICERS' ASSOCIATION.**

THE annual meeting will be held in the Council Chamber, Guildhall, E.C., on Tuesday, February 9, 1897, at 8 o'clock P.M. Mr. J. L. Wanklyn, M.P., who has taken charge of the Local Authorities Officers' Superannuation Bill, which was read a first time on January 25, will address the members on that subject. The Right Hon. the Lord Mayor of London will preside at the annual dinner to be held on Saturday, February 27, at the Holborn Restaurant, when he will be supported by the Right Hon. Lord Balfour of Burleigh, Chief Secretary for Scotland; Sir J. Blundell Maple, M.P.; Mr. J. L. Wanklyn, M.P.; the Clerk to the London County Council, the Town Clerk and City Solicitor of London, the Town Clerks of Birmingham, Crewe, Devonport, Douglas, Huddersfield, &c., and many others holding important municipal and local government positions.

Early application for tickets (price 5*s*. each) should be made to the hon. secretary, Mr. C. J. F. Carnell, 33 Paulet Road, Camberwell, S.E.

**GLASGOW SCHOOL OF ART NEW BUILDING.**

IT having been decided to erect a School of Art in connection with the Art Gallery and Museum in Kelvin Grove, twelve architects were invited to compete, with the result that the designs of Messrs. John Honeyman & Keppie were selected.

The building is to be erected on a piece of land lying immediately to the north of the Panorama buildings in Sauchiehall Street, between Dalhousie Street on the east and Scott Street on the west, and having a frontage to Renfrew Street. The building itself will face due north, with a length of 250 feet and a depth of 77 feet. The plans show a three-storeyed building—a basement and two floors—the ground to the north being excavated to form an area for lighting the lowest floor. The entrance is in Renfrew Street, the main door being situated in the centre of the façade. A service door has also been made in Dalhousie Street for access to a janitor's house and for the reception of material. The staircase of the building is situated in the rear centre, and access to all floors is gained from and by it. The upper floor contains the life rooms (male and female), antique rooms (elementary and advanced), a school museum and a board-room. The middle floor is occupied by ornament, still life and design rooms, and the school library and lecture theatre. The basement holds the accommodation for modelling (large antique and ornament), architectural rooms and the technical rooms. In these will be

placed a forge, a kiln and a muffle. The basement also contains a house for a caretaker, the heating apparatus and various store-rooms. The administration is situated in the centre of the building, and on the first floor. The elevation presents the appearance of a plain business-looking edifice. The upper floor is lighted by large square-headed windows, and every care has been taken to secure a sufficiency of light for every room in the school. All rooms in which instruction is to be given are lighted from the north, the only light taken from the south being that available for the corridors, which on each floor run from one end of the building to the other, at the southern side of the edifice. The light from the south is obtained by the use of wells, there being no reservation in favour of windows in the southern wall. The whole of the plans will be on view in the Corporation Galleries till February 16.

### PROPOSED ASYLUM FOR NOTTS.

At the last meeting of the Notts County Council Alderman W. E. Denison, in moving the adoption of the report of the lunatic asylums building committee as to a report from the Lunacy Commissioners with respect to the new asylum, referred to the demand made upon them in respect of the accommodation to be provided. The committee, having regard to the existing number of patients in the present lunatic asylum, thought that accommodation for 400 patients, with administrative capacities for 500, would be amply sufficient, and this was referred to the Home Secretary. The Lunacy Commissioners, however, made a minimum accommodation of 500 beds, with administrative capacity of 600. That demand, they thought, was too large, but they had reconsidered the matter, and now requested that they should provide beds for 450, with administrative capacity for 550. To that they had not received any answer, and he was rather afraid that the Lunacy Commissioners, who had somewhat extravagant ideas, would adhere to their former decisions. Until they got their final decision they were, to a certain extent, at a standstill. Mr. Hooley and Mr. Sander had sketched out most admirable and original plans, but they could not proceed with details until it was known exactly what accommodation they had to provide. The only other question was with regard to the farm. Originally the tenant did not seem inclined to come to terms or to go on with his farm. In some ways, perhaps, it would be better for the Council to take

the matter in hand and to farm the land, but there was a great difficulty with regard to supervision, and they were now discussing with the tenant whether he should not continue his farm, farming as the committee directed, for a length of time. He rather thought that the tenant might do so. If he would not, they would be obliged to take it in hand, but he did not think the cost would be very much. The greater part of the land would be laid down to grass, and they could let it.

It was mentioned by Mr. Francklin that the original estimate of the cost of the building was 70,000*l.*, and they might fairly assume that it would expand itself to 100,000*l.*, but if they had to provide room for 600 patients it would greatly exceed that sum.

After considerable discussion upon the question of who should carry out the architectural work, the report was adopted.

### A STEEL PIPE PRISON.

A REALLY new idea deserves credit for its rarity, if for no other reason. The San Francisco papers give Mr. Frank T. Shea the credit of originating one in prison construction which we learn the Patent Office, that refuge of new ideas, has never known before. To be brief, says *Architecture and Building*, Mr. Shea, architect of the Hall of Justice, proposes to construct the cells of steel pipes to be filled with water at high pressure. At the desk of the sergeant in charge of the prison will be a gauge similar to a steam gauge on a boiler, by which the exact pressure of the water will be registered. If a prisoner should attempt to cut his way out of the prison by filing one of the steel bars a stream of water would escape as soon as he filed through the pipe. Simultaneously with the escape of the water an electric bell on the gauge at the sergeant's desk would ring and the indicator would show the number of the cell where the prisoner was trying to escape. This would seem to put an effectual stop to future gaol deliveries, and if generally adopted any future Jack Sheppard stories will lack foundation; but they say no lock has ever been made but some one has been found smart enough to pick it. But another question arises as to the value of these tubes, that is, how long before the action of water upon them would render them defective and perhaps deluge the prisoners. While we cannot fail to appreciate the ingenuity of the scheme or its novelty, still before its adoption it might be well to look for possible defects, for to be good at all it must be very good and very permanent.

# ELECTRIC LIGHT

## THE NEW CONDUIT SYSTEM

New Buildings can now be fitted with Insulated Iron Tubes whilst in course of erection, ready for cables and wires to be drawn through at any future period.

## NEW CATALOGUES.

MESSRS. THOS. CRAPPER & CO., Marlborough Works, Chelsea, are sending out a copiously illustrated catalogue of some 150 pages, showing all their various specialties, such as air-tight manhole covers, air inlet valves, automatic flushing tanks, cast-iron and porcelain baths, cast-iron drain pipes and junctions, elastic valve closets, enamelled fire clay sinks, grease traps, gully traps and galvanised iron tanks and cisterns. Some of their bathroom fittings are particularly noteworthy, No. 1 for instance, a cast-iron bath, enamelled inside, with galvanised supply and waste pipes, spray enclosure with shower and douche in copper, combined hot and cold nickel-plated supply valves, with mahogany or walnut enclosure and hand-painted tiled-back skirting, is a very handsome and comprehensive fitting. Many designs are given of plain and ornamental lavatories, the firms' well-known specialties in closets, &c., and the prices are all as moderate as is consistent with excellent materials and workmanship.

MESSRS. EASTON, ANDERSON & GOOLDEN, of Erith Iron-works, Kent, and 3 Whitehall Place, S.W., have also issued a catalogue, which contains nearly eighty illustrations (many of them full-page ones) of pumping machinery, water works, centrifugal pumps, water wheels, turbines, hydraulic rams, boilers, steam engines, cordite machinery, Grafton high-speed engines, hydraulic and electric lifts, hydraulic presses, electric mining machinery, electric tramways, electric lighting, dynamos and motors, cranes, pulverisers, &c., as well as views of important works executed by the firm for public bodies in England and abroad; and the prices of machinery for different purposes are given.

MESSRS. WATSON, LAIDLAW & CO., engineers, millwrights and machine makers, Glasgow, whose specialties are their hydro-extractors, send us a catalogue containing illustrations of the different varieties of these, both hand and power driven. There are also sketches of the firm's self-balancing oil separator, patent centrifugal friction pulley, &c.

## MINERAL WOOL.

ACCORDING to Consul Merritt, of those who know mineral wool, or silicate of cotton as it is sometimes called, probably only a small number are familiar with the simple process by which it is made. The wool itself, serving a variety of useful purposes, as a non-conducting covering against heat and cold, alike for steam-pipes and cold storage-room walls, as a sound deadener in floors of buildings, and as a means of fireproofing, is, as its name implies, a soft and woolly substance, consisting of a mass of very fine mineral fibres interlacing one another in every direction, and thus forming an endless number of minute air-cells. The wool appears on the market in a variety of colours, principally white, but often yellow or gray, and occasionally quite dark, and is made by converting scoriæ and certain rocks, while in a molten state, into a fibrous condition by a steam blast directed against the liquid material. Blast furnace slag forms the raw material for one variety of the wool and sandstone for another, yielding respectively slag wool and rock wool, the latter being preferable for pipe covering because of the absence of sulphur, which, with moisture present, becomes an active corroding agent. The furnace slag or the rock, as the case may be, is melted in a large cupola, and as it trickles out at the tap-hole in a somewhat sluggish stream it meets a high-pressure steam jet, which atomises the woollen material, if it may be so termed, blowing it in fleecy clouds into the storage-room provided for it.

Soft and downy, the stuff settles wherever a resting-place offers itself, the heavier wool coming down first, while the lighter portions are blown further along by the force of the steam, and settle in the more distant parts of the room. The material thus naturally grades itself into varieties of different qualities. A thousand pounds of wool per hour are turned out by one of the cupolas, and after the storage-room has been blown full the flocculent mass is pressed into bags, ready for the market. The whole process, says the consul, affords an admirable and interesting illustration of the utilisation of a formerly waste product.

## AN AMENITY COMMISSION FOR NEW YORK.

A CHARTER for "Greater York" is under the consideration of special commissioners. The Fine Arts Federation have submitted the following proposals to insure the erection of sculpture and other memorials in the public places of the city which shall have some claim to be considered works of art:—

Section 1. There shall be an art commission for the city of New York, composed as follows:—

1. The mayor of the city of New York.
2. The president of the Metropolitan Museum of Art.
3. The president of the New York Public Library (Astor, Lenox and Tilden foundations).
4. The president of the Brooklyn Institute of Arts and Sciences, *ex-officio*.

One painter, one sculptor, one architect, all residents of the city of New York, and three other residents of the city of New York, none of whom shall be a painter, sculptor, architect, or member of any other profession in the fine arts. All of the six last mentioned shall be appointed by the mayor from a list of not less than three times the number to be appointed, proposed by the Fine Arts Federation of New York.

The head of each of the city departments shall, *ex-officio*, act as a member of the commission in all matters of which it takes cognisance pertaining to work under the special charge of his department.

Section 2. The painter, sculptor and architect members of the commission shall choose by lot one, two and three-year terms of office; the three other appointed members of the commission shall also choose by lot one, two and three-year terms of office, and the appointment of their successors, after the expiration of the first year of this commission, shall be for a term of three years. All appointments to fill vacancies shall be for the unexpired term.

In case any vacancy shall occur in the commission by reason of death, resignation, incapacity, refusal to serve, or otherwise, the vacancy shall be filled by appointment, as provided in section 1 of this chapter. In case the Fine Arts Federation shall fail to present a list of nominees as aforesaid within three months from the time when any appointment is to be made, the mayor shall appoint without such nomination.

Section 3. The commission shall serve without compensation as such, and shall elect a president, vice-president and

secretary from its own members, whose terms of office shall be for one year and until their successors are elected and qualified. The commission shall have power to adopt its own rules of procedure; five commissioners shall be a quorum.

Section 4. Suitable offices shall be provided by the city for the commission. The expenses of the commission shall be paid by the city; the amount of the same shall be fixed annually by the Board of Estimate and Apportionment.

Section 5. Hereafter no work of art, namely, no paintings, mural decorations or stained-glass, no statues, bas-relief or other sculpture, no monuments, fountains, arches or other structures of a permanent character, whether for ornament or commemoration, when the property of the city or intended so to be, or which shall extend over or upon any street, avenue, square, common, park, municipal building or other public place belonging to the city, shall be erected by or become the property of the city of New York, whether by purchase, gift or otherwise, unless the location and design (and if requested by the commission a complete model) for the same shall first have been submitted to and approved by this commission. Neither shall any existing work of art in the possession of the city be removed, relocated or altered in any way without the similar approval of this commission, except as provided in section 7. When so requested by the mayor or the City Council the commission shall act in a similar capacity, with similar powers, in respect to the designs of municipal buildings, bridges, approaches, gates, fences, lamps or other structures upon land belonging to the city, and in respect to the lines, grading and plotting of all public ways and grounds, when the property of the city or intended so to be, and located as above mentioned; also in respect to all arches, underground or elevated ways, bridges, approaches, the property of any corporation or private individual within the boundaries of the city, which shall extend over or upon any street, avenue, park or public place belonging to the city.

Section 6. If the commission shall fail to decide upon any matter submitted to it within sixty days after such submission, its decision shall be deemed unnecessary.

Section 7. In case the immediate removal or relocation of any existing work of art shall be deemed necessary by the mayor, the commission shall, within forty-eight hours after notice from him, approve or disapprove of such removal or relocation, and in case of their failure to so act within forty-eight hours after the receipt of such notice, they shall be deemed to have approved of the same.

Process Blocks of every description made from Drawings in Pen and Ink Line, or Wash, and Photographs, to print with type, on an entirely new method, giving greater value and effect to the picture, with strong definition of detail.

Our special treatment of Pencil Drawings is being largely adopted by Architects, Publishers, and Art Journals.

For Particulars and Specimens apply to ALFRED FISH, Manager.

**A BRICK COUNTRY ROAD.**

THE first brick country road laid in the United States has been put down in Monmouth township, Warren county, Ill. The road is the culmination of a series of experiments in road-building, and though it is regarded as more or less on probation, the utmost confidence in its success is expressed. When hard-road building began in the township, four years ago, it was decided to expend the money in hand in an experimental way. Monmouth township had long been a sufferer from bad roads. In winter the town had often been completely blockaded by mud too deep for waggons. Even within the town itself the streets were so poor that at times the "bus" lines were obliged to suspend business, and mail and baggage were carried to the railway station on wheelbarrows. The manner in which the roadway was laid is described as follows:—The ground was prepared for it by grading, and being allowed to stand for two months. It was treated to an occasional scraping, so that it would pack evenly, and when the contractors were ready to lay brick it was as hard and even as a floor. The first thing was setting the curbing. This was made by 2 inch by 6 inch oak plank, set 7 feet apart, and held by oak stakes 18 inches long and put down every 4 feet. Inside this was put a 5-feet bed of sand. This was evened up and the single course of No. 1 paving-brick was put down. They were set on edge and make a fine road-bed. Outside of the curb 2 feet of crushed rock was laid, graded up to make an easy approach. This makes a road 11 feet wide. The earth on each side was graded and worked, making it all 40 feet wide, and affording tracks on each side for use in dry weather. The average cost of the stone roads has been 70 cents per foot. The brick road cost 2,600 dols. for 3,000 feet, or about 90 cents a running foot.

**CLEVELAND HOUSE.**

ON Tuesday Mr. Tewson, of Messrs. Debenham, Tewson, Farmer & Bridgewater, offered for sale at the Mart, Tokenhouse Yard, the freehold site formerly occupied by the historic mansion known as Cleveland House, 19 St. James's Square. The area is about 11,300 square feet. The house itself has been completely demolished, the portico alone remaining. The property, with Raby Castle and other estates of large value,

was comprised in a settlement made by the first Duke of Cleveland in the year 1809. In 1866 these estates were charged with an annuity of 4,000*l.* for the life of the Duchess of Cleveland, who is still living. In 1872 the then duke, who was tenant for life, purchased the reversion in fee in Cleveland House. On the death of the last duke Lord Barnard became entitled to the house. The land tax on the premises has been redeemed, but it is one of the conditions of sale that the purchaser will, under an Act of 12 George II., be liable to contribute to the expense of cleaning, adorning and beautifying St. James's Square, and the property is subject to a perpetual annuity of 16*l.* 19*s.* 2*d.* per annum. The bidding started at 40,000*l.*, and reached 57,500*l.*, at which price the property was declared to be unsold. It is understood that the purchase price was 65,000*l.* It may be interesting to point out that, even in so exclusive a square as St. James's, the shopkeeper has recently set his foot, and one of the attractions of the site offered for sale is that it is "adapted for the erection of a series of handsome shops."

**NATIONAL ASSOCIATION OF MASTER BUILDERS.**

THE National Association of Master Builders of Great Britain has held its thirty-eighth half-yearly meeting at Blackburn, and representatives were present from Liverpool, Blackburn, Bolton, Southport, Wigan, &c. Mr. Thomas F. Rider, who presided, said that though the state of trade generally was good, they had to deplore ruinous competition in all trades throughout the country. It seemed to him that competition up to a point was a very valuable thing, but he objected to "cutting each other's throats." This competition seemed to increase as years went on. Another thing that they had to consider was the old complaint of the "British workman," whose desire seemed to be to give the smallest possible amount of work for the largest amount of wage. The only remedy seemed to be a revival of the system of payment for piece work. As regarded the Employers' Liability Bill, no doubt this would be of a considerably more stringent character than ever. It seemed probable they would be held liable for accidents of every description, whether caused by negligence or otherwise, and he thought that this liability might be met by joint insurance. The question of arbitration had taken up a great deal of time with many of the associations. The President spoke at length as to the best form of contract, and stated that the

old form agreed upon more than twenty-five years ago still continued in use in face of a new and more elaborate one prepared by the Institute of Architects, and this principally because of the unfairness of the arbitration clause, which, he said, was the most important part of a contract. Finally, he wished to increase the scope of the National Association of Master Builders, and make it in every sense a "national" association. The form of apprenticeship indentures was discussed, and it was decided to leave the matter over. The secretary read a resolution of the London Central Association as to the scarcity of plasterers. The President said they had had considerable trouble in London, and one thing had been proved to them, viz., that the supply of plasterers was insufficient. Various ways had been suggested of increasing their numbers. Among them were:—(1) To increase the number of apprentices; (2) to find a substitute for plastering; and (3) to maintain schools of plastering. It was decided to refer the matter to the Council. Mr. T. F. Rider (London), Mr. J. Stevenson Jones (Liverpool), and Mr. Alderman W. Holdsworth (Bradford), were re-elected to the positions of president, senior vice and junior vice-president respectively for the ensuing year. Mr. A. Krauss (Bristol) was elected hon. auditor for the ensuing year. Mr. G. Hardington (Leicester) and Mr. R. Jenkin (Plymouth) were elected as members of the Council for their respective towns. Mr. C. A. Hayes (Bristol) invited the members of the Association to hold their next half-yearly meeting in his city, which was unanimously agreed to.

### BIRMINGHAM SURVEYOR'S DEPARTMENT.

A REPORT of the public works committee on the reorganisation of the city surveyor's department has appeared. After conference with Mr. Price, the new city surveyor, the committee have approved a plan, the chief features of which may be briefly stated as follows:—1. The formation of a secretarial department, in order that all correspondence, reports and other documents relating to the several branches in the department may come directly under the cognisance of the city surveyor. 2. The gathering together in the accountant's department of all the accountant's work, instead of some portion being kept in one and some in another department, as previously. 3. The filling up of vacancies in the drawing and surveying department, the work of which, especially in connection with the survey of the city and the terrier of Corporation property, is in

arrears. 4. The reorganisation of the building surveyor's department, by the division of the city into five districts, each under the charge of a district building surveyor responsible for carrying out the Acts of Parliament and bye-laws in his own district; the district surveyors reporting to and receiving instructions through the chief building surveyor or his deputy, who will remain at the Council House, receive and examine plans, &c. 5. The formation of a department called the Sewerage and Rivers Department. The importance to the health of the city of a thorough and systematic supervision of the 260 miles of sewers cannot be over-estimated, and the committee considered that the system best calculated to ensure satisfactory results was that of dividing the city into five districts, each under the charge of an inspector responsible to the superintendent of the department for the proper maintenance, flushing, &c., of all sewers and drains, and the supervision of the construction of all new sewers and drains. 6. The reorganisation of the roads and scavenging department. Prior to 1884 the city was divided into three districts, each of which was under the charge of a district road surveyor; but for reasons then stated to the Council it was thought advisable to abandon this system, and place the supervision of the whole of the roads under one official. With the increased area of the city, consequent upon its extension, and the ever-increasing mileage of streets, which has risen from 192 in 1884 to 254 at the present time, it is manifestly impossible for one person to properly supervise between 500 and 600 men employed over so large an area. The committee have therefore divided the city into five districts, each of which they have placed under a district surveyor, who is responsible for supervising the construction of new streets, and for the maintenance and scavenging of all streets within his district. Mr. Buckley, the present road surveyor, will take charge of the central district and will supervise the work of the other district surveyors. 7. The committee have not found it necessary to make any material alteration in the public lighting (lamps) department, but the superintendent and clerical staff will be brought from Park Street to the Council House. 8. They have formed a new department, called the mechanical and electrical department, which will have charge of works connected with the tramways, electric lighting, &c. Up to the present the office of electric inspector, the appointment of whom, under the electric lighting orders, is obligatory upon the Council, has been held by Mr. Henry Lea, of Bennett's Hill, at a salary of 150*l.* per annum. Mr. Lea has informed the committee that, owing to the increase in the work since his

appointment, and having regard to the increased duties cast upon him by the order of 1894, the salary was inadequate. The fees received last year by Mr. Lea, and paid to the borough fund, amounted to 171*l.* 16*s.* 6*d.*, and the committee, considering the growth of this work, and the probable adoption of electric motor power in connection with the tramways, which would require skilled supervision, concluded that the time had arrived when the whole time of a capable electrician could be utilised in the service of the Corporation. In this conclusion they are confirmed by the practice in other principal towns of the United Kingdom. The work hitherto performed by Mr. Piercy in connection with the tramway engines and the steam road-rollers, the payment for which amounts to about 250*l.* per annum, would be also transferred to this department. By a rearrangement of duties and promotion of present officials, the carrying out of this plan will involve an addition of about twelve persons to the staff of the department. The committee have appointed Mr. W. H. Worthington, who has been nineteen years in the department, to the office of secretary, and Mr. A. M. Rose, the deputy accountant, with eighteen years' service, to the office of accountant. Mr. Collins, the late accountant, has been placed in charge of the clerical staff of the lamp department. Mr. A. G. Reid, who has been in the drawing office thirteen years, has been retained as superintendent of that branch. Mr. F. W. Lloyd having resigned the office of building surveyor, the committee advertised for candidates, and appointed Mr. Henry Price, chief assistant inspector of buildings of Liverpool, in his place, at a salary commencing at 220*l.*, and rising by annual increments of 10*l.* to 300*l.* per annum, the amount of Mr. Lloyd's salary. Mr. John Knight has been appointed engineer in charge of, and superintendent of, the sewers and rivers department. Mr. Buckley is retained at the head of the roads and scavenging department, and Mr. W. Green, sen., at the head of the public lighting department. Mr. T. Arnall has been given the office of superintendent of the mechanical and electrical department, and Mr. W. J. R. Thomas, A.I.E.E., electrical engineer to the St. Pancras Vestry, has been appointed electric inspector at a salary of 200*l.*, rising by 10*l.* per annum to 230*l.* The offices of district surveyors and inspectors have been filled up, after advertisement and careful inquiry, and the committee believe that this department—which has the expenditure of nearly 200,000*l.* per annum, and should therefore, in the interests of economy and efficiency, be properly officered—is now in a better position to carry out its important duties according to

the requirements of modern sanitation. In making these changes the committee have had regard to their cost, and are convinced that the additional cost, if any, will be but slight, while a much more effective service will be insured.

### THE CHELSEA FORESHORE.

AMONGST the schemes before Parliament which in one way or another affect open spaces, that which will perhaps most keenly interest London is, says the *Times*, the Bill of the County Council to extend the Chelsea Embankment from Battersea Bridge to the bridge of the West London Junction Railway. At first sight it would seem that nothing but benefit would arise from the prolongation of so delightful a promenade as the Chelsea Embankment, but there are features of the Council's proposal which are open to serious objection. Above Battersea Bridge the river bank on the Middlesex side describes a wide curve, and in the shallow bight of the Thames thus formed barges sail at high water and cargoes are discharged alongside a wooden jetty. When the water is out there is all the picturesque disorder incident to riverside wharves at low tide, and the broad stretch of wet mud reflects the sun's rays in many colours. Turner's house, of which much was recently said, stands about half-way up the curve, and from the roof where he used to work he must often have studied the varied scene below him. So constantly frequented, indeed, is the spot for artistic purposes that a small garden at the north end of Battersea Bridge has been set aside for sketching. The design of the Council is to carry an embankment wall from this very spot in a straight line to a point near the railway bridge, thus canalising the river on its north side and completely destroying the outline of the natural waterway. The river will be much narrowed, and one would imagine that the effect must be to throw the water at high spring tides on to the Surrey side and thus aggravate the flooding from which the low lands of Lambeth have already suffered. However this may be, the river will certainly be deprived of all beauty of line between the two bridges, and London will lose a picture of much charm. But this is not all. The Council take power to lease for building all surplus lands acquired for the purpose of the embankment. As the total area taken will extend to several acres, and there is no provision for the formation of embankment gardens, or even for the setting out of a road of any prescribed width, there cannot be a doubt that the Council would be entitled to line their

new embankment with rows of high houses, accentuating the hard line to be given to the river-bank, shutting out from their river view the houses at present standing in Cheyne Walk—amongst them the beautiful Lindsey House—and occupying a considerable area which London now enjoys as an open space. It is really a happy touch of humour that the Council propose to levy a betterment rate on the persons interested in the houses which may thus be thrown into a back street.

It is said that the mud which is so dear to painters is insanitary, and the vestry of Chelsea are, we believe, supporting the Council's proposal on this ground. This is a question which can, of course, only be decided upon evidence; but, even if we assume that there may be good grounds for some embankment, there seems to be no reason why it should be carried in a hard straight line from point to point, and there is every reason why all reclaimed land should be preserved as an open space. The charm of the existing Chelsea Embankment consists in its broad roadway and ample gardens. A similar treatment should be applied to the proposed extension, and not an acre of land now free from building should be covered with bricks and mortar. These are conditions which depend on general principles, and which the House of Commons might reasonably be asked to impose before the Council's Bill goes to a committee.

Amongst other private Bills affecting open spaces the most objectionable is that of the East London Waterworks Company, which contemplates the absorption of 100 acres of Tottenham Marshes for the purpose of reservoirs. The open marshes along the Lea are pre-eminently the playing-fields of London, and should be preserved inviolate. If waterworks are required in the neighbourhood, land in private ownership should be taken for the purpose. The promoters of waterworks, indeed, are now more dangerous enemies to commons than railway companies. The Leeds Corporation, for instance, wishes to put hands on more than a hundred acres, while the total area affected by railway Bills is under fifty. Two of the great companies, the Great Western and the London and North-Western, recognise the sound principle that where the interests of the railway demand that common-land should be taken an equivalent area should be given elsewhere. On the other hand, there are one or two instances in which commons are bisected and thus seriously injured. Parliament has of late years uniformly condemned such proposals, and the Commons Preservation Society may be trusted to see that they do not escape notice.

## SOCIETY OF ENGINEERS.

THE first ordinary meeting of the Society of Engineers for the present year was held on Monday evening, February 1, at the Royal United Service Institution, Whitehall. Mr. Samuel Herbert Cox, the president for 1896, occupied the chair, and presented the premiums awarded for papers read during that year, viz.:—The President's Gold Medal to Mr. George Thudichum, for his paper on "The Ultimate Purification of Sewage;" the Bessemer Premium to Mr. D. B. Butler, for his paper on "The Effect of Admixtures of Kentish Ragstone, &c., upon Portland Cement;" the Rawlinson Premium to Mr. W. G. Wales, for his paper on "Discharging and Storing Grain;" and a Society's Premium to Mr. M. A. Pollard-Urquhart, for his paper on "Examples of Railway Bridges for Branch Lines."

Mr. Cox introduced the president for the present year, Mr. George Maxwell Lawford, to the meeting, and retired from the chair, receiving a hearty and unanimous vote of thanks for his services during the past year.

After briefly reviewing the work of the Society during the past year, the President drew attention to the steady reduction in the general death-rate of this country during the last fifty years and the comparative freedom from zymotic diseases, both of which were attributed to the progress of sanitary science and the impetus given to the practice and study of hygiene by the Public Health and River Pollution Prevention Acts. The provision of pure water and efficient drainage was the duty of the engineer, and on these two subjects, which are of such vital importance to all communities, the President based his address.

After alluding to the discoveries of Pasteur and the influence of biology in its relation to the purification of water, he contrasted the system of lake supplies, as instanced by the water undertakings of Glasgow, Manchester, Liverpool and Birmingham, with the metropolitan supply, which, coming from such polluted sources as the Thames and Lea, was entirely dependent for its bacterial purification on sand filtration. He further contrasted the successful municipal enterprise of the four cities mentioned with the working of the London companies, which are managed solely in the interests of the shareholders, finally expressing the opinion that the London supply should be managed in the consumers' interests by a body from which party and political feeling should be entirely excluded.

A short description was then given of the Zurich waterworks,

which he had recently visited, and which are of exceptional interest to engineers by reason of the striking example they afford of "the conversion of the great sources of power in nature to the use and service of man," the river flowing from the lake being utilised not only to pump the entire water supply of the town, but to generate both hydraulic power and electricity for lighting, motors and traction. Drainage was then dealt with in its relation to water supply under the three headings of the house, the sewer and the outfall. Special reference was made under the second heading to Mr. Parry Laws and Dr. Andrewes's researches on sewer air and the organisms in flowing sewage, the conclusions arrived at tending to show that both sewer air and sewage were hostile to pathogenic (or disease-producing) organisms. The third heading, the outfall, opened up the great problem of sewage disposal, and after again alluding to the important part played by bacteria in the purification of sewage, the President emphasised the fact that there could be no universal panacea for sewage purification, and that every case must be dealt with entirely on its own merits and with special regard to the local conditions and surroundings. Reference was made to sludge and its disposal, and to the generation of steam power by the utilisation of two hitherto waste products—sludge and domestic refuse in combination with the refuse destructor. In conclusion, the President stated that in his opinion no scheme of water-supply could be considered complete unless it was supplemented by an efficient drainage system, and that by devoting their attention to the hygienic requirements of all classes of the community, engineers contributed their share to the health, and consequently the prosperity, of the nation.

#### ART v. UTILITY.—THE CHICAGO POST OFFICE.

The correspondent of the *American Architect* in Chicago writes:—

The supervising architect for the new post office in Chicago, Mr. Henry Ives Cobb, and Mr. Hesing, the postmaster, seem not to have reached a common understanding about that building. Apparently, from letters exchanged between them, Mr. Hesing has not been consulted by the architect concerning the needs of the post office, which Mr. Hesing is naturally more familiar with than Mr. Cobb. When the latter carried his plans to the Postmaster-General, he refused to accept or endorse them until they had been submitted to Postmaster Hesing and Inspector J. E. Stuart, who has charge of all rents

and leases relating to the postal service. Mr. Cobb returned to Chicago, had several conferences with these two gentlemen, and the above-mentioned letter was the result. As Mr. Hesing's letter has a bearing on the general question of how to plan a post office, it seems worth while to make the following extracts from it:—

"I am compelled to state, from the standpoint of a practical post-office official, that while you have perfectly solved the question of light and ventilation, and have drawn plans for a building that are beautiful and that will be a monument to your genius as an architect from a strictly æsthetic point of view, the interior arrangements as laid out will not at all suffice.

"I realise the great difficulties to be surmounted when you are asked to construct a building that will do, as it were, for a factory and for a residence. As I have always contended, the post office should be in a building devoted solely to post-office purposes, where the entire business could be done on two floors.

"After a thorough study of the situation I am convinced that to make the best use of the plans submitted by you, the following points must be conceded, and if any one of these points is not conceded, the building, as far as the arrangements of the post-office department are concerned, will be a total failure.

"The points upon which I must insist are:—

"1. The entire first and second floors and a portion of the basement must be given up to the post office to be arranged to suit its necessities. I mean to say by that that this space must be kept absolutely clear of all partitions and obstructions not required for postal business.

"These two floors and basement should be left by you for the time being simply as a great space. You cannot, as an architect, be expected to know what the post-office needs are, nor how it desires to lay out the floor-space. Give that department the space, and it will cheerfully assist in laying it out.

"2. All mail must be received and despatched from the street level, and no mail shall be received or handled in the basement. The very idea of asking a man to work in the basement is itself enough to condemn the plans submitted. It was this fact more than any other that prompted me to take the interest I did in agitating for the erection of the new building. Men should not and must not be expected to do accurate post-office work and quick work in a basement. The basement can be utilised for file-rooms, lockers, cashier's stock-room, supplies, janitor's shops, and postal-card sub-agency.

## FRÉDUREAU'S PATENT LIGHT DIFFUSING GLOBES, FOR ELECTRIC LIGHT AND INCANDESCENT GAS.

Prices on Application.

Telegrams, "SANDBAGS, LONDON."

"3. I insist that the Government should construct this building to suit its business, to satisfy its officials and not to be mutilated to gratify the whims of adjoining property-owners.

"I know that architects are great sticklers for symmetry, but symmetry must sometimes give way to utility.

"4. The railway mail-service, post-office inspectors and Civil Service Board must have convenient quarters above the second-floor and some additional room may be required for the use of the post office proper."

Mr. Hesing further stated, "I have always contended that the Government made a mistake in locating the new building on the old site. But it is too late to change that now, but the interior plans drawn by Mr. Cobb will have to be changed as I refuse to 'O. K.' them.

"I insist that the basement and the first and second floors, which are designated for post-office use, shall be turned over to the practical official in charge of the office, without any walls, rooms, partitions, elevators, or pillars. Then these practical men can divide the space allotted to the service to the best advantage."

The letter is called by one of the papers "friendly, but emphatic," which very accurately describes it, for to say that it breathes a spirit of firm determination is a mild manner of putting it.

### AMERICAN FIRE ESCAPES.

The following regulations for fire escapes have been adopted in Philadelphia:—

In accordance with the Act of Assembly, approved June 3, 1885, and the Ordinance of Councils, approved December 10, 1896, and supplemental thereto, the following formula will govern the matter of the design, construction and erection of all fire escapes hereafter required within the city of Philadelphia.

**Platforms.**—The platforms shall consist of iron balconies not less than 4 feet in width, the length of the platform to be dependent upon the size of the building and the number of its occupants. The inspector of the district will designate the length of such platform, which shall extend in front of, and not less than 9 inches beyond, at least two windows, except in the case of a doorway leading from the floor level of the building to the floor level of the platform, in which case such doorway opening will suffice. Each platform shall be provided with a

landing at the head and foot of each stairway of not less than 24 inches. The stairway opening of the top platform to be no longer than sufficient to provide clear headway. The floors of balconies must be of wrought-iron or steel,  $1\frac{1}{2}$ -inch by  $\frac{5}{8}$ -inch slats, not more than  $1\frac{1}{4}$  inch apart, and be securely rivetted to frame and brackets. Outside angle frame to be not less than  $2\frac{1}{4}$ -inch angle iron. If flooring is made of wire, same to be not less than No. 6 wire gauge,  $\frac{3}{4}$ -inch mesh, securely fastened to frame and brackets. All stair openings to be sufficient to provide clear headway. In all cases platforms must be designed, constructed and erected to safely sustain in all their parts a safe load at a ratio of four to one, of not less than 80 lbs. per square foot of surface.

**Railings.**—The outside top railing to extend around the entire length of the platform and through the wall at each end, and to be properly secured by nuts and washers, or otherwise equally well braced and bolted. The top rail of the balcony must not be less than 1-inch pipe iron, or material equally as strong. The bottom rail must not be less than  $\frac{3}{4}$ -inch pipe iron, or material equally as strong, well leaded into the wall. The standards must be not less than 1-inch pipe iron, or material equally as strong, and must be securely connected with top and bottom rail and platform frame. Standards must also be securely braced by means of outside brackets at suitable intervals. Railings in all cases to extend around the stairway openings, and be continuous down the stairway. The height of the railing to be not less than 3 feet.

**Stairways.**—Stairways must be designed, constructed and erected to safely sustain in all their parts a safe load, at a ratio of four to one, of not less than 100 lbs. per step, with the exception of the tread, which must safely sustain at a ratio of four to one a load of 200 lbs. per tread. The treads to be not less than 6 inches wide and the rise not more than 10 inches. The stairs in all cases to be not less than 24 inches wide, and the strings or horses to be not less than 3 inch channels of iron or steel, or other shape equally as strong, and to rest upon and be fastened to a bracket, said bracket to be fastened through the wall as otherwise provided for brackets. The strings or horses to be also securely fastened to the balcony at the top. The steps in all cases to be double rivetted or bolted to the strings or horses.

**Brackets.**—Brackets must not be less than  $2\frac{1}{4}$ -inch angle iron, or material equally as strong, not more than 3 feet apart, braced by means of not less than 1 inch square, or  $1\frac{1}{4}$ -inch round iron, let into the wall at least 4 inches, with shoulders on brace, and 3-inch washer between shoulder and wall, and to

## THE SOUTHAMPTON STEAM JOINERY CO., BELVEDERE WORKS, SOUTHAMPTON.

London Office: 11 Clement's Inn, Strand, W.C. Estimates supplied.

Manufacturers of JOINERY suitable for all purposes, from the Cottage to the highest class of Mansion and Public Building.

**IN HARD OR SOFT WOODS.**

Church, Bank, Office, Shop, Ship, Yacht and other Fittings. School Seats and Desks. Chimney-pieces. Horticultural Buildings, &c.

**MOULDINGS, ELECTRIC LIGHT CABLE CASINGS AND COVERS.**

**STEAM SAWING, PLANING, AND MOULDING MILLS.**

Joinery and Fittings have been manufactured at these Works (which are the largest in the South of England) for some of the most important buildings in this Country and Abroad.

**READING CASES.**—A NEW well-made Reading Case for "THE ARCHITECT" can be supplied on application to the Publisher, the charge for which is 2s. 6d.—Address, P. A. GILBERT WOOD, 175 Strand, London, W.C.

VOLUME LV. OF THE ARCHITECT.  
Handsomely bound in Cloth, Gilt Lettered, price 12/6.  
Office:—175 Strand, London, W.C.

extend down the wall 4 feet from the top of the bracket and out on the bracket angle 3 feet from the wall. In all cases the bracket angle directly under the balcony must be secured to the wall by means of bolts of suitable size passing through the wall and 4-inch washers. There must also be a bar of wrought-iron or steel, 2 inches by  $\frac{3}{8}$  inch, let into the wall 4 inches edgewise between the brackets and rivetted to the balcony for the floor to rest upon. Whenever the bottom balcony is supported by means of suspension rods (rivetted or bolted) to the balcony above, the brackets (of the above balcony) shall be increased in size to meet the increased strain occasioned thereby. The bottom balcony to have a drop ladder of same construction as the stairway, to be hinged and hung with a counter weight. Whenever the drop ladder is upheld by means of a counter balance weight suspended to a chain, such weight shall hang within the platform railing if practicable.

In all cases the bolts, rivets and other material used shall be proportioned so as to develop the full strength of the members connected by them.

All the parts of such fire escapes must receive not less than two coats of paint—one coat in the shop and one after erection.

### THE TRADE MUSEUM OF NUREMBERG.

IN the report on technical education by Sir P. Magnus and Messrs. Redgrave, Swire Smith and Woodall, M.P., is the following account of the Nuremberg Trade Museum:—

On the occasion of our visit to the Gewerbe Museum, Nuremberg, we were met by Herr L. Erhard, the curator of the mechanical and technical division of the Museum, and Dr. P. J. Ree, the librarian and secretary. Handsome new buildings were nearly completed to replace the old ones in the centre of the town, which have been lately given up. This institution, described by us in our former reports, is somewhat on the model of that of Stuttgart, but contains certain features which are peculiar to it. The director of the Museum is Herr Th. v. Kramer, who is also the architect and director of the exhibition. According to the prospectus the work of this institution is carried on under eight different divisions:—

1. The collection of patterns or samples, which consists of 10,000 specimens of ancient and modern examples of works in wood, metal, glass, clay, leather and paper. Also woven fabrics, embroideries, laces, &c. Certain of these objects can be obtained on loan. This section is really the applied art

museum, as the specimens comprise examples of workmanship from all countries and of the best periods of art.

2. The collection of designs, which consists of some 60,000 sheets of illustrations of art industries of all periods and all nations. These mounted sheets are classified under various heads and arranged in glass cases for easy reference by manufacturers and students. To procure these designs recourse has been had to illustrated works on ornament and art workmanship and to the best serial publications of all countries. Opportunity is afforded for consulting them and for copying them, and the officials undertake to prepare special designs and sketches for fees to be arranged.

3. The library and reading-room contains upwards of 13,000 volumes of art, industrial and technical works, also about 136 journals and periodicals relating to these subjects which are taken in regularly and filed. In connection with this section we noticed an extensive series of foreign directories, trade catalogues and address books of other countries.

All the above departments are open free to the public.

4. The mechanical and technical division may be said to include two chief departments:—

Section I.—The office for specialised trade information relative to:—

(a) Patents, merchandise marks and trade marks. In this section applicants can have patents secured for them at fixed charges, and trade marks can likewise be registered.

(b) For furnishing information of all kinds on motors, machines, tools, raw products and manufactured goods.

(c) For supplying literary advice and references from technical works. Replies to general technical questions.

Section II.—This constitutes the experimental research department, arranged for the trial and testing of gas, benzine and petroleum motors, steam-engines, water-wheels, turbines and electro motors, as also all labour-saving machinery at agreed charges.

5. The chemical laboratory, which occupies itself with investigations of all kinds relative to technical and industrial chemistry, and further, is prepared to undertake analysis, and to carry out more extensive researches for fees to be arranged. The official testing station for paper is in connection with this branch.

6. A permanent exhibition of modern industry and art. Temporary exhibitions of special departments of manufactures. Distribution of prizes to meritorious exhibitors out of a fund founded by King Ludwig of Bavaria.

# THE NEW EXPANDED METAL

*Meshes from  $\frac{1}{8}$ th in. to 6 in. wide. Strands from 24 B.W.G to  $\frac{3}{16}$ th in. thickness of steel.*

**FOR BUILDING CONSTRUCTION**, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

**FOR SOLID PLASTER PARTITIONS**, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

**FOR FIREPROOF LATHING**, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

**FOR CONCRETE FLOORS WITH EXPANDED METAL**.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

**FOR EXTERIOR WALLS OF BUILDINGS**.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

**FOR FENCING, TREE GUARDS, WINDOW GUARDS**, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

**ORNAMENTAL. STRONG. CHEAP.**

**OTHER USES FOR EXPANDED METAL**.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away. Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

**BRASS, ALUMINIUM**, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal and the rapidity of manufacture allows of very low prices.

**CATALOGUES AND PRICE LISTS** can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

## THE EXPANDED METAL COMPANY, LTD.,

39 UPPER THAMES STREET, LONDON, E.C.

Telegraphic Address, "Distend, London."

Works—WEST HARTLEPOOL.

Telephone No. 1829.

7. Issue of the Bavarian trade journal delivered to subscribers of the institution at the price of 10 marks; to non-members 16 marks per annum. This is the official organ of the Bavarian Industrial Museum.

8. The delivery of public lectures and addresses during the winter months, embracing information on all subjects of art applied to industry and every branch of manufacturing activity. Lectures to the members of allied societies in other towns. Classes for technical drawing for adults engaged in industrial pursuits.

An interesting feature in the activity of this Museum which was brought under our notice was the so-called Gewerbe-Archiv, or factory register, which includes a brief account of all the more important industrial establishments in Bavaria, contributed by the manufacturers themselves on a special form. The particulars given are as follows:—The name and address of the firm; when founded; articles produced; whether special to this undertaking; character of motive power employed; nature of machinery used, and the number of each kind of machine; patents, trade marks, &c., owned by the firm, with indication of registered number, &c., of the same; exhibitions in which the firm have taken part, and prizes and medals awarded. Further, as optional information, the number of workpeople employed and the annual value of productions. Many thousands of manufacturers have already contributed to this register, and every effort is made to keep it up to date and to render it accurate and complete as a record of the whole of the industries of Bavaria.

The assistance in the matter of patents, merchandise marks and trade marks offered by this establishment seems very comprehensive and embraces much of the work done by the patent agent in this country. The payments received in remuneration for these and similar services by the staff are placed to the credit of the Gewerbe Museum, and are employed in amplifying the collections and extending the work of the mechanical and technical sections. We were conducted over the new building and saw the museum-rooms, library and lecture hall. The chemical department will be in a separate building, and it is at present housed in temporary premises. The various departments are well arranged and the Museum is very extensive. The cost so far is upwards of 40,000*l*. The collections at the time of our visit were for the most part stowed away in consequence of the building operations. We were much pleased with the design and fittings of the libraries and museum-rooms, which are admirably adapted to their

purpose, and the building, when finished, will serve as a model for institutions of this character, which appear to be multiplying in Germany. The officials and staff of this Museum have been largely engaged in connection with the Nuremberg exhibition, and to them and to the able director of the Gewerbe Museum, Herr von Kramer, the success of the undertaking is largely due.

## PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

### APPLICATIONS FOR PATENTS.

- 1289. Jeshurun Coulthurst, for "Improved means for joining sanitary pipes."
- 1292. Henry Hocking, for "Improvements in liquid supply taps."
- 1299. Carl Erlinghagen, for "Improvements in sheet-iron corrugated roofings."
- 1650. Percy Hugh Pritchett, for "Improvements in stoves or fireplaces."
- 1705. Thomas Smart, for "Improvements in or relating to wire-cutting apparatus for cutting bricks or the like."
- 1785. Alexandre Edmond Thomine, for "Improvements in pipe joints."
- 1805. Samuel Acton, for "A new or improved expansion joint for steam and hot-water pipes, also applicable as an ordinary joint."
- 1815. Edward George Highton, for "Improvements in water-waste preventers for flushing purposes."
- 1839. James Smith, for "Improvements in chimney-pots."
- 1844. Joseph Schoberl, for "Improvements in or relating to smoke-consuming furnaces."

To INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 37 Chancery Lane, London, W.C.

W. WATSON & SONS, (Sole London Address) 313 High Holborn, London.  
STEAM FACTORIES, 9, 10, 11, 16, & 17 FULLWOOD'S RENTS, W.C.

ACTIVE preparations are being made at the Windsor Station of the Great Western Railway for the erection of the "Queen's Room" of the new terminus, which is to be finished before June, in readiness for the use of Her Majesty when proceeding to and returning from London during the Jubilee commemoration.

THE Bury Town Council have ratified the resolution retaining the services of Mr. Cartwright, borough engineer, who has applied for a position at Sheffield. They agreed to pay 750*l.* for his services in constructing the reservoir and sewage works, granted him a limited private practice and consented to his retaining his present position for two years at least at 600*l.* per annum, and then to be consulting engineer for three years at 250*l.* per annum.

THE trustees of the Primitive Methodist Chapel, New Brompton, Kent, have approved of sketch plans for new chapel and Sunday schools to be built upon the site where existing iron church stands (Gillingham Road), and have instructed their architect (Mr. E. J. Hammond, New Brompton) to proceed with the plans and specification forthwith.

AT a meeting of the Edinburgh Architectural Society, held on the 3rd inst. in Dowell's Rooms—Mr. W. N. Cumming, vice-president, in the chair—a lecture entitled "Pre-Conquest Stone-carving in Northumbria" was delivered by Mr. D. J. Vallance, curator of the Edinburgh Museum of Science and Art, and illustrated by limelight views. There was a good attendance.

IN the course of some excavations which were being made in Waller Street, Luton, the workmen came across two bricked cavities, extending about five feet beneath the pavement. The floor of one is laid with dark-blue tiles, and the arched roof is covered with red tiles and bricks. On the floor were found a quantity of bones and cows' horns, as though the spot had been a place for the disposal of refuse. It is computed that the tiles, cement and bricks are at least 1,000 years old, and the cavity is believed to be a hypocaust, or an oven, which was in use at the time of the Roman occupation.

16,500*l.* is the amount of damages awarded in the London Under-Sheriff's Court in respect to the compulsory acquirement of the freehold of Nos. 80 and 81 Strand, for the purpose of the Hôtel Cecil's approaches and of the Strand improvement scheme.

TWO altars, which have recently been erected in the handsome new church of St. Bridget, Bevington Hill, were

inaugurated on Sunday morning the 7th inst. The high altar, which is dedicated to St. Bridget, consists of a plain alabaster table resting on steps of St. Anne's marble. From the table rises to a considerable height a handsomely wrought reredos, in which are inserted sculptured panels showing scenes from the life of St. Bridget. In the centre is placed a massive tabernacle of Caen stone, and at either side are niches intended for the reception of statues of Saints Patrick and Columbkille. The lady altar, though not so large, is also a pretty piece of workmanship.

THE parish church of Irvine was reopened on the 7th inst. for public worship. The whole of the seats in the area and four of the older sections of the gallery have been renewed and the church has been otherwise modernised. The porches which projected into the interior have been cleared away, the stairs leading to the galleries have been partitioned off, and are now only indicated by sets of three-light windows filled with tinted cathedral glass, and the pews to right and left of the organ have been moved out some distance from the wall, placing the congregation in that part of the church more within range of the pulpit. The parish church of Irvine was built in the year 1774.

THE extensive additions to the Johnstone Combination Hospital, which have been carried out to the plans of Mr. J. L. Cowan, architect, Wellington Street, Glasgow, were opened for public inspection on Saturday, the 6th inst. The cost of extension so far as completed, with auxiliary plant, machinery, &c., will reach about 4,000*l.*, while it will take about another 1,000*l.* to complete improvements yet unfinished. The new block added embraces three wards, and a wing of the present hospital has been greatly enlarged. The whole work has been carried out with all modern improvements adapted for the thorough equipment of an infectious hospital. The drainage has been dealt with in a thorough fashion by filtration, and a laundry has been added, and also a discharge block for patients. In eight days the wards will be ready for occupation, and the work carried out now will provide ample hospital accommodation, it is expected, for the districts of Johnstone, Kilbarchan, Houston, Linwood, Kilmalcolm, Lochwinnoch and other parts for many years to come. An additional acre of ground has been enclosed, and the grounds are being tastefully laid off. The contractors were:—Messrs. Keanie & Co.; Purdon & Cuthbertson; Marshall, Kilbarchan; M'Queanie, Glasgow; Cormack & Sons, Glasgow; M'Connell, Johnstone; Tullis & Co., Clydebank.

## TRADE NOTES.

THE well known and established business of Messrs. W. Gradwell & Co., timber and stone merchants, of Barrow-in-Furness, is being brought out as a limited company. Six hundred and forty 6 per cent. cumulative preference shares of 10s. each are offered to the public. The certificate of Messrs. W. B. Peat & Co., chartered accountants, of Barrow-in-Furness, shows that a very satisfactory profit has been made during the last seven years. Mr. W. Gradwell has agreed to act as managing director for the next five years.

THE new schools, Barry Dock, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

## ELECTRIC NOTES.

MESSRS. JOHN DEWAR & SONS, LIMITED, of whisky renown, have now direct communication by telephone between their London office in Lime Street and their Perth office in Glasgow Road.

WE hear with regret of the death of Mr. John Faulkner, who died in his seventy-fourth year on the 7th inst. at his residence in Strangeways. He had been connected with electric science for upwards of sixty years. He attended the lectures at the Victoria Gallery, Manchester, under James William Sturgeon. He was one of the first to introduce a perfect system of conductors for the protection of buildings from lightning. His "electric kite" was applied in early days to high steeples and tall chimneys. One of his earliest applications of electricity was made in connection with signals and bells for coal mines.

In 1875 he invented improved electric magnetic telegraph sounders and bells. One of these sounders was adopted by Professor Bell in his earliest telephonic experiments, and was first exhibited at the Centennial Exhibition at Philadelphia in 1876.

## BUILDING AND BUILDERS.

THE Hon. Walter Rothschild will lay the foundation-stone of the South Hackney Synagogue and classrooms, which are being erected from the designs of Mr. Delissa Joseph, on the 14th inst.

THE Leeds Church Extension Society have secured a site at a cost of £450 for a proposed new church on the Victoria Park Estate, midway between the churches of Bramley and Kirkstall.

THE new theatre at Deptford will be one of the largest in the Metropolis, and the plans have been prepared by Mr. W. G. R. Sprague, the architect of several of the latest suburban and provincial theatres. The work of clearing the site has commenced, and the theatre is expected to be ready by next October. The cost of the building and site will be 45,000s.

THE foundation-stone of the new masonic temple being erected at the junction of West Stewart Street and Argyll Street, Greenock, at a cost of 4,000s., for the use of the members of the Greenock Lodge St. John's, was laid on Saturday last.

## BUILDING TRADES EXHIBITION.

## MEETING OF CONSULTATIVE COUNCIL.

A MEETING of the consultative council of the above exhibition was held at the offices, 43 Essex Street, Strand, W.C., on Friday, the 5th inst., Professor Banister Fletcher, J.P., F.R.I.B.A., presiding. There were present Messrs. Ellis Marsland, P. N. Hasluck, F. T. W. Goldsmith, A.R.I.B.A., Chas. Barry, F.S.A., F.R.I.B.A., E. W. Thornton, A.R.I.B.A., A. H. Ryan Tenison, A.R.I.B.A., Gilbert Wood, E. J. Kibblewhite, H. Riches, W. G. Penty, F.R.I.B.A. (York), W. Seckham Witherington, F.R.I.B.A., John P. Seddon, F.R.I.B.A., A. J. Gale, F.R.I.B.A., Lewis Angell, C.E., F.R.I.B.A., Edwin O. Sachs, A.R.I.B.A., G. M. Callender, H. Phillips Fletcher, A.R.I.B.A. (hon. secretary), H. Greville Montgomery (manager).

Letters of apology for non-attendance were read from Messrs. John Belcher, F.R.I.B.A., R. Wilkie Edis, F.R.I.B.A.

The minutes of the previous meeting were read and confirmed, and a report was read as to the prizes promised in connection with the handicraft competitions.

It was agreed to ask architects and others for the loan of drawings and models of buildings, and it was decided to hold conferences during the exhibition in the different sections of the building trades.

It was suggested that various associations connected with the trades be invited formally to the exhibition during the time it is in progress.

The designs for the poster on view at the offices, for which a premium of 10*l.* was offered, created a lively amount of interest to those present, and an informal plébiscite of the best design was taken.

Various other business was gone into, and it was agreed to hold the next meeting of the council at the Royal Agricultural Hall just previous to the opening of the exhibition.

### CONTRACTORS' ACCOUNTS.

A CORRESPONDENT of the *Canadian Architect and Builder* offers the following suggestions on the preparation of estimates and the keeping of accounts:—

A well-digested method in making out estimates is the first element of success, and to arrive at this method considerable brain effort must be expended and some clerical labour employed. A proper list of everything required about a building must be prepared—preferably in alphabetical order—with prices of the material given, and, where possible, price of labour in setting or finishing in part or whole. To this must be added cost of delivery in the works, insurance and a fair percentage for contingencies. The orderly estimator will first take a survey of the ground on which the building is to be erected; he will consider the means of getting his materials on the ground. Then he will find out by actual measurement the amount of excavation necessary and the distance he has to remove such earth as must be carted away. The amount of stone and brickwork, the number of yards of concrete or cement floor required, and all the drain tile will be counted up; each kind and quantity charged in the estimate under its own heading. So with everything about the building, timber, nails,

paint, glass, plastering, hardware and the thousand and one other things necessary to complete the contract; everything charged in its proper place accompanied by such remarks as may be deemed pertinent. And, at this point, let me remark that seventy-five per cent. of the troubles that befall the country contractor at least—and this applies also in large measure to contractors everywhere—are due to ignorance or disorderly estimating.

Two things the young contractor should avoid are hasty and disconnected estimates and the acceptance of work on another man's figures, unless that man is an expert and paid for preparing the figures. The unwary contractor who has no confidence in his own figures becomes an easy prey to the unscrupulous owner, who does not care a snap who loses money so long as he gets his work done at a low figure. A contractor who allows his desire to get the "job," or whose necessities impel him to take the work for whatever he can get for it, stands on the brink of ruin, and is sure to be crowded to destruction by the time—or before—the works are finished. Be sure your figures are right; knowing this, nail them to your mast, as it were, and stick to them to the end, unless you find you have omitted something, rendering your tender too low; then ask to be allowed to add the deficiency, and if not permitted, withdraw from the contest. It is not often, however, that the orderly estimator overlooks an item of material or an hour's labour.

The work having been awarded, immediately set to work to provide materials, so that as soon as operations commence there need be no cessation for lack of stuff until the completion of a building. Make a full and complete set of bills of material, taking the quantities from the estimate, and be sure you get what you order, both in quality and in quantity. If you use any stone, arrange to pay for it as measured in the wall—100 feet to the cord. Of course, dimension stone will be paid for by the foot, or as may be agreed upon. Look carefully after your brick during delivery, and see that you do not get more than your proper allowance of "bats" and "soft bricks." House your lime as soon as it is on the ground, and be sure you get the quantity you are billed with. Keep an eye on everything you have placed on the ground. Overhaul your lumber bills and have the number of joists, studs, rafters and all dimension stuff tally with your order and with your bills. Do this without delay, so that discrepancies may be adjusted while the matter is fresh. Make arrangements with your painter to have all shop work primed as soon as it leaves the

### THE COUNTY COUNCIL WORKS DEPARTMENT.

AT the inquiry of the special committee of the London County Council on the 5th inst., Mr. H. Holloway, president of the Master Builders' Association, gave evidence. He said he was a member of the firm of Holloway Brothers, building contractors. There was no such thing as a ring of contractors in London against the Council. The contractors, however, objected to some of the conditions of contract, and unless those conditions were modified, he did not think the Council would get the first-class contractors to contract for its work. They objected to the words of the wages clause compelling the contractor to pay the full current rate of wages "obtained by the trade unions of the London district." He did not object to the "current rate of wages" being inserted. The contractors also objected to being compelled to disclose their books to the officials of the Council. He thought inspection of the time-sheets and wages-books would be sufficient; examination of the contractors' other books was unnecessary and offensive. He objected to the system of open tenders, preferring that of select tendering. Contractors would not care to be put into competition with the Works Department of the Council. If the Council had an honest desire to get tenders from responsible contractors they should, as near as possible, adopt the form of contract which had been agreed to between the Institute of Architects and the Institute of Builders. He considered that the work of responsible contractors was of quite as good quality as that done by the Works Department. He could see no advantage to the workman obtained from the Works Department which he did not obtain from respectable contractors.

The Chairman: Then if the Council has made conditions which no contractors will accept, a Works Department becomes a necessity?—My point is, that it is only these conditions which are keeping contractors out, and that they are not essential to good work being done for the Council. I think these conditions should be abrogated.

By Sir G. Lushington: In putting the words "rate of wages obtained by trade unions in the London district" in the contracts the Council was really making itself an engine for enforcing the policy of trade unions, and was placing itself in antagonism to contractors.

By Dr. Longstaff: The system of open tendering was a fad of public bodies. It was diminishing at the present time, because these bodies were getting wise from experience and were adopting a system of select tendering. The trade union system was good for young men but hard and cruel to older men. He honestly believed that the objectionable conditions of the tenders for the superstructure of Bexley Heath Asylum were inserted to prevent responsible contractors from tendering. It was his deliberate opinion that the labour clauses in the contracts were passed for the direct purpose of preventing contractors tendering for the Council's work.

By Mr. Beachcroft: In the 60,000*l.* worth of work his firm had done for the Council, they had certainly made a profit of more than 1½ per cent. It was impossible for any committee of a public body to successfully compete with his firm.

By Mr. Davies: He was not against municipal work, but architectural work could not be done so well by a municipality as by a building contractor.

By Mr. Fletcher: It was unfair to the workmen of London for the Council to attempt to do its work all over London with 2,000 men employed at the centre. It might give rise to the creation of a privileged class of workmen.

By Dr. Collins: Alterations had been made by the Council in the conditions of contract at the express request of the master builders. The Council in its terms of contract had all along done everything to protect the workmen and not the contractors.

By Mr. Dickinson: He should think that in London there were quite 100 "respectable" contractors who might be put upon a list, and from that list the Council should from time to time choose firms to contract for its work.

At the conclusion of the examination of the witness the committee adjourned.

Mr. J. Mowlem Burt, of the firm of Messrs. Mowlem & Co., contractors, gave evidence on Wednesday. He said his firm had done a great deal of work for the Council. He had no objection to the rates of wages being set out in the schedule to the Council's contracts, but he thought that in any variations in wages during the execution of a contract, the sum paid under

the contract should be proportionately enhanced or reduced. He suggested that the wages clause should read simply that the wages paid should be those agreed upon between the masters and the men. He objected to the words of the contracts, "in practice obtained by the trade unions." He did not think trade unions should be the arbiters of the wages. Both young men and men who were past their best work suffered greatly under the present system, because naturally the contractors could not pay them full wages. That prevented them from being employed on works under the Council. He also objected to the penalty clauses of the Council's contracts, since they gave the impression that the Council regarded all contractors as men who were not to be trusted. His firm had never been harshly dealt with by the Council. The clause in the contracts compelling the contractor to submit his books for inspection if so desired was very vexatious. He thought it would be sufficient for the Council to inspect the wages and time-sheets. His firm had not ceased to tender, but they could not accept contracts under the present conditions. In the tenders they had sent in they had struck out the objectionable clauses. His firm would not object to tender in competition with the Works Department—at least, until they found it was useless. By that he meant that a time might come when they found the Works Department made a very low offer, and then came to the Council for more money. The inspection clauses absolutely prevented them doing work under contracts which contained those clauses. He desired the employers to have a voice in the wages to be paid. His firm, being general contractors, hardly saw the same objection to the arbitration clause that builders in the strict sense of the term would see. They were generally willing for an engineer to be the sole arbitrator, but they should certainly object to the architect being the sole arbitrator. There was a distinct feeling in the building trade that the Council, in insisting on these objectionable clauses desired to prevent contractors from tendering. He thought the system of select tendering as adopted by the London School Board a good one. He did not believe that architectural work could be carried out by a corporate body as cheaply as by contractors. He should doubt whether the visits of an average County Councillor to the works would be of the same advantage as his own visits would be.

Mr. Rowland Plumbe, who has acted as architect for the erection of some of the Council's artisans' dwellings in connection with the Shelton and Boundary Street schemes, said that

the work executed by the Works Department was as good as that executed by ordinary contractors. He was unable to see any difference in the amount of work done by the men for contractors and that done for the department. The supervision of the work was as effective in the case of the department as in work carried out by contractors. He thought it would be best for the Council to put out to contract the highly-technical building work. Sewer work, he thought, might well be carried out by the Council, for in that class of work contractors usually made large provision for risk.

The proceedings were again adjourned.

### THE DANGERS OF SEWER GAS AND THE LIABILITIES OF SANITARY AUTHORITIES.

At the time that the decision was given in the case tried at the Birmingham assizes, August 1896 (executors of T. H. Smith v. King's Norton Rural District Council), we commented upon the facts disclosed and the importance of the decision to sanitary authorities. It may be as well to refresh our readers' memory by a short *résumé*.

The late Mr. Smith, it was alleged, died from an illness which was attributed to sewer gas, which entered his house through the ventilating shaft from a sewer. The District Council denied that any damage was caused by their negligence, and declared that the condition of the house drains was rather the cause of Mr. Smith's illness and death. That the illness was in some way connected with defective drainage there could be no doubt. The house was erected in 1885. From the drains near the site a shaft was carried up a tree. At the desire of the architect the position of the shaft was changed, and it was fixed within the chimney, the alteration being the work of the builder of the house. The shaft was leaky, and the connection with the drains was inefficiently executed. It was given in evidence that fumes found their way into the library, where Mr. Smith spent much time. Nobody in the house appeared to have any knowledge of the existence of the shaft, and when the scrutiny was made the evil had done its work, for other members of the family suffered, but not fatally.

Mr. Justice Collins, before whom the case was tried, said the question for the jury was whether Mr. Smith's death was caused by the escape of gas from the sewer ventilator, or by

the condition of the house drains. After a long consideration the jury were unanimous that death was caused by an escape from the sewer ventilator, and the damage was assessed at 3,500*l*. This brings the danger arising from sewer gas forcibly before us, and the necessity of destroying it instead of dispersing it through the atmosphere, and also the great liability the sanitary authorities incur who neglect to provide proper means for the destruction of sewer gas.

The present system of taking ventilating shafts outside houses is altogether wrong, as unless they are run up to a great height above the houses they aggravate the dangers they are supposed to obviate, and if brought up alongside a chimneystack the gas will descend through the flues, and consequently disseminate the deadly poison even more directly through the house than would be the result through a defective drain. In short, the only method that will insure safety is by destroying absolutely the gas, and this can only be effected by burning it, as is done in the sewer gas destroyer lamps. There have been in use for some years different systems which have proved successful to a great measure, but have not been perfect, amongst the defects being the liability of the lights going out on the occasions of flooding when the sewers are running full bore, and the risk of explosion at these times. In the system invented by Mr. J. E. Webb (and which is in use at the Strand (London) Board of Works, Shoreditch, Tottenham, Hereford, Southampton, Wolverhampton, Tettenhall, Leicester, Leamington, Malvern, Paris, &c.) all objections in previous attempts are entirely done away with, which will be proved by the following extracts we make from the report on sewer ventilation by the city surveyor of Hereford to the sewers committee:—

*Webb's Sewer-gas Destructor.*—This consists of an ordinary street gas-lamp, having a copper pipe inside the cast-iron column.

The gas-burners and lantern-head are so arranged as to do the threefold work of lighting, extracting and destroying, or rather converting the sewer-air into a harmless compound.

One great merit I attach to this lamp is that if the products of combustion from the sewer be from any cause temporarily arrested, and the light becomes extinguished, there is no risk from explosion, as the by-pass light is supplied with air from the outside atmosphere by a separate pipe, which would automatically relight the three burners on the obstruction being removed or by the sewage falling to its normal level.

Although we have had severe gales and phenomenal floods during the past week, in no case has the light failed, while of

the Holman's type two were extinguished once, and a third two mornings in succession.

The average rate of extraction I found to be 2,291 cubic feet per hour, which is largely in excess of the quantity claimed for it by the inventor.

The nearest air inlet is in Kerry Square, while it is also clearing the sewer in Widemarsh Street, as far as Blackfriars Street on the one hand and the Mansion House on the other—a total length of 1,200 yards of sewer.

The air leaving the outlet at the top of the lamp was perfectly free from offensive smell on every occasion examined.

The illuminating power of the gas appears to be considerably increased by the use of sewer air instead of ordinary atmosphere.

The lamp could not be put to a more severe test in Hereford, owing to its close proximity to the Imperial Brewery (from which offensive liquids of a high temperature are frequently discharged into the sewer), and the Worcester hide and skin yard also delivers most offensive matter into the sewers within 80 yards of the lamp. Many cases of zymotic disease have occurred in this district, and frequent complaints of sewer gas were formerly received from the residents in the neighbourhood, but since the erection of the lamp I have not heard a single complaint; on the contrary, those in the immediate vicinity are pleased with the improved light, as well as the absence of smells. The high rate of temperature maintained (500 degs. Fahr.) is such that no germs can by any possibility pass through the lamp into the atmosphere alive. The only smell on approaching as close to the outlet as the heat will permit is such as is felt near the ceiling of a room where a number of gas jets are alight.

The first cost of this lamp and connection to the sewer is 20*l*. 3*s*. 8*d*., or about 15*l*. in excess of an ordinary lamp column and lantern head. The annual cost is the same as an ordinary gas lamp, while the light is much more brilliant than that of a lamp consuming the same quantity of gas.

The conclusion I have arrived at is that Webb's lamp is, under all conditions, the best, both as regards annual cost, simplicity of construction and the higher temperature to which the sewer air is subjected before escaping into the atmosphere.

Since the above report was made the ninth order has been received from the city of Hereford.

Taking into consideration the great risks involved by the neglect to insure the effective destruction of sewer gas, it becomes a duty for all in charge of the sanitary matters of towns to become acquainted with the system by which Mr.

### THE DWELLING-HOUSE.

ON Thursday, February 4, Dr. G. Vivian Poore, F.R.C.P., delivered a lecture at the London Institution on the "Dwelling-house," illustrated by numerous lantern-slides. After pointing out the defects commonly seen in the better class of London houses—extreme height in proportion to area, dark underground basement, absence of back-door for delivery of goods or removal of refuse, ill-ventilated staircase and close "areas" shutting in the gullies leading to the sewer—the lecturer insisted that, although such defects were inevitable in London, they should never be imitated in the country. Great height not only increased the risks from fire, but increased the labour of service, because moving vertically involved twenty times the labour of moving horizontally. The risks from infectious disease were greatly increased by these high houses, which were getting daily more common. Modern methods of sanitation gave a fatal facility for overcrowding, which was certain eventually, if not checked, to do more harm than the sanitation had done good.

In country places, where it was possible to give adequate area to a house, it was most important to insure the thorough ventilation of the staircase and passages, and if this were neglected these internal communications only served for the drifting to and fro of foul air and not for the supply of fresh air. In dwelling-houses as in hospitals, all sanitary offices should be shut off by a ventilated lobby from the main structure, and the lecturer showed plans by which the staircase might be made to fulfil this purpose. The question of aspect, the advantages and disadvantages of a cellar beneath a house and the great importance of a wholesome larder were points which received attention.

The lecturer next considered plans by which the sanitation of an isolated house might be made independent of the local authorities, and he showed plans of "filtration gutters" by which domestic slop-water might be easily purified.

Overcrowding was the greatest of all sanitary ills, and was often fostered by sewage schemes. A plan was shown of an estate of 9 acres lying between two newly-sewered suburban roads, which had, as was usual in such cases, been bought by a so-called building society, and in which 177 houses with a

population of over 1,200 was contemplated. These societies were a cause of sanitary ruin, æsthetic ruin and financial ruin; they encouraged artisans to begin life with a mortgage round their necks, and occasionally landed them in the clutches of a professional usurer.

Some of the model by-laws of the Local Government Board were not suited for country places, and regulations as to air-space round dwellings which might be beneficial in towns became mischievous suggestions when printed and circulated in the country. Again, the London Building Act placed no adequate check upon enormous structures, and "open spaces" (bought at great cost) were definitely made an excuse for the abolition of private curtilage to houses. These large buildings were common in the centre of London, and it was curious to note that the "Strand Registration District," which is the pulpit from which we have preached sanitation to the whole world, and which is exceptionally well provided with open spaces, was, next to the city of Liverpool, the most unhealthy registration district in the country. So-called "lungs" in which the blood only circulates occasionally on a Sunday are no compensation for a lack of space and light and air in the dwelling.

The cost of the dwelling-house was steadily increasing. Taking a concrete example in Marylebone, it was shown how the rates had risen 87 per cent. in 23 years, and how the whole of the obligatory charges—rent, rates, taxes and water—amounted to over 2½ per annum per square yard of occupied land. Would this upward tendency of the rates ever cease?

Increase of cost of the dwelling inevitably led to overcrowding, and every addition to the rates increased the cost of the dwelling. Looking at the physical and moral harm which resulted from overcrowding, every increased tax on the house ought to be very seriously considered. Schemes of ostentation and so-called philanthropy which fell heavily on the householder in the form of rates did harm rather than good. Some outlet ought to be left for private generosity. Very little was done to check overcrowding. On the contrary, the jerry-builder was fostered at the expense of the ratepayers. Modern sanitation was largely based on a mischievous, lop-sided socialism which was doing incredible harm. No improvement could take place unless it were found possible to encourage the sanitary well-doer. If the man who built a wholesome, isolated house, and completed his sanitation on his own premises, was merely "rated up" and practically fined for doing so, no improvement was possible. The lecture concluded with sundry suggestions for the equitable adjustment of sanitary rates.

**YORKSHIRE COLLEGE ENGINEERING SOCIETY.**

At a meeting of the members of this Society, held on the 1st inst., Mr. Benjamin Holgate, F.G.S., delivered an interesting lecture on the subject of "Clays used for Making Bricks and Pottery." The president of the Society (Mr. Henry McLaren) occupied the chair. The object of the lecture, as Mr. Holgate explained, was a very practical one. It would doubtless be that in time to come many of the students might find themselves following their profession in distant lands. He wished them, therefore, to be able to judge as to the suitability of any particular clay for the manufacture of bricks, and the criteria to be set before them would, he hoped, assist them to form an accurate conclusion. Mr. Holgate detailed the various kinds of clays which might be observed in the colour and nature of the class of buildings erected in different localities. For instance, commencing in Dorsetshire, and travelling thence through London to Yorkshire, they would note that the materials used gradually changed. In Dorset all the buildings were of brick, and that was so through London and as far as Huntingdon. In East Yorkshire, as at Brough, they would find almost the same kind of cottage as in the Fen district—very old buildings, with very thick walls compounded of mud, lime and gravel. In the great Vale of York, however, they would notice that all the villages were ruddy with their red-tiled roofs. In West Yorkshire, as they approached the hilly country, they would find, as in Leeds, many of the houses were built of bricks well blackened over, but before that they often saw the bricks "sweating," and showing a deposit of white salt. Further west, where the rocks were near the surface, the houses were built of freestone, and up to recently were also covered with thin flagstones of the same material. In Oxford and Cambridge the buildings were of oolitic limestone, which soon decayed, and had a venerable appearance. In the slate country houses were naturally built of slate. At the present time the great majority of buildings were built of bricks moulded either standard size, or in any form that might be desired. Mr. Holgate dealt also with china, tertiary, gault, drift, carboniferous and ganister clays, and the treatment of carboniferous, also touching on fire and ordinary bricks. He gave a scientific definition of the substance of clay, and a practical commentary thereon. He mentioned that at Poole, in Dorsetshire, there was a bed of 500 different kinds of clay, and remarked that it was from that place that the makers of clay smoking-pipes in Leeds obtained their material. The brick-making value of clay depended on

its-fluxing qualities. In conclusion, Mr. Holgate said he hoped that, by carefully studying the subject from the points he had given them, any of the students present, when they came across a suitable clay, even in a country they had not seen before, might be able to say, "Here is a clay from which bricks can be made."

An entertaining and instructive discussion followed.

**THE COST OF BOARD SCHOOL BUILDINGS.**

A SPECIAL sub-committee of the Works Department of the London School Board, appointed to inquire into the cost of the schools erected by the Board, for the purpose of ascertaining whether any reduction of expense could be made, have presented their report. It appears that the cost of building ran up considerably between 1885 and 1895, the cost per head on main school buildings, including halls and drawing classrooms, being from 10*l.* 13*s.* to 15*l.* 15*s.* 9*d.* in the latter year, as compared with 7*l.* 0*s.* 1*d.* to 9*l.* 1*s.* 11*d.* in the former. In a report made to the sub-committee, the architect of the Board suggests that the standard of building which was appreciably raised in 1888, as the result of the recommendations of a special committee, is almost beyond the necessities of the case. The object to be gained is to find a satisfactory mean between the two extremes of inferior building and of luxuriously expensive workmanship. The question of sanitation has of late years come prominently to the front, and the exactions of the local sanitary authorities have tended to enhance considerably the cost of public buildings, while the new London Building Act of 1894 involves additional expense. Having called attention to other matters involving additional cost in school construction, the architect suggests that, with a view to reducing expense, the general standard of ten years ago should be reverted to, "which would only mean the abandonment of the little luxuries added from time to time." In another part of the sub-committee's report the general advance in the cost of building between 1885 and now is assessed at from 7½ to 10 per cent. The great advance in London during the past year is said to be due to the state of the labour market, the results of the various trade disputes being evident and undeniable. The risks which contractors run in this direction have caused a general advance in rates to meet contingencies. After considering the views expressed by their officers, the sub-committee recommend the Board to revert to the old specification in force

in 1885-86 for all future schools and enlargements, subject to such modifications as the architect may think it necessary to make in order to bring the specification up to the present requirements of the Board and the Education Department. There are also various recommendations with reference to the materials used and the method of using them, the object being to reduce the cost of school buildings.

### TRAMWAYS IN BERLIN.

AT the meeting of the Board of Works for the Holborn District the following report by Mr. Lewis H. Isaacs, the surveyor, was read:—

Gentlemen,—Consequent on the presentation of a numerous signed memorial from the occupiers of premises in Theobalds Road urging the Board to lay down a noiseless carriageway pavement in that thoroughfare in lieu of the existing granite setts, and a promise having been made on the part of the Board that the matter should receive immediate and favourable consideration, I deemed it my duty to institute inquiries how the wishes of the memorialists could best be complied with, regard being had to the rights of the North Metropolitan Tramways Company to run their cars over the surface of that road.

I ascertained that the matter had not only been considered, but the problem had been solved by the municipal and tramway authorities in the city of Berlin, and I proceeded on my journey to that city on Saturday, the 16th ult.

The distance being considerable, and the weather exceedingly severe, I determined to break the journey outwards by stopping at Brussels and Cologne, and on my return to visit Hamburg, in all of which cities I was informed that tramway works both novel and important in character had recently been executed, and I may here state that I was well repaid for the extra time and trouble consequently involved.

I found, however, that the mode of working rather than the construction of the tramways in these three cities were the matters calling for observation and report on my part, for the employment of noiseless pavement has not made much progress as yet in any of them. Brussels, indeed, owing to its surface levels, is practically debarred from the use of asphalt as a paving material, for not only is it a hilly city, but those hills are both long and steep.

It may be stated briefly that the employment of horses for

the haulage of tram-cars is rapidly disappearing in the cities I have just visited, and electricity is the motor now generally adopted. I am informed that it is cheaper than traction by horses, and the municipal authorities encourage its use because it is so much more cleanly so far as the surface of the streets is concerned. In illustration of what I am here stating in regard to the action of the municipal authorities in this matter, I may mention that as the concession to the larger of the two tramway services in Berlin is about to lapse, it has been intimated to the directors of that company that the concession will not be renewed unless horse traction is done away with and another motor substituted.

Steam as a motor has been tried, but has failed to give satisfaction, and in no single instance did I find petroleum, gas or compressed air employed. The noise of steam, which is such a terror to horses, and the vapour given off by petroleum are both avoided. I find also that the overhead system of supplying electricity is apparently the one which finds most favour, though I must confess that the appearance of the streets and roads is not improved by its adoption.

Of the four cities I have named, Berlin is pre-eminently the one most suited for intra-mural communication by means of tramways. Its surface, like that of the entire State of Brandenburg, is almost a dead level, and the inhabitants of the city have not been slow to avail themselves of the natural advantages thus afforded for pleasant and cheap conveyance through the streets of the capital and its suburbs.

They have also in the plodding but thorough manner of the German race, addressed themselves to the solution of the problem how to combine the advantages of an agreeable and cheap means of locomotion with a sanitary and noiseless pavement, and from what I saw in Berlin I think they may be congratulated upon succeeding in so doing. Since I was last there some five or six years ago, the city has grown very much, and the number of its inhabitants now stands as high as 1,600,000.

By the courtesy of Mr. Louth, the representative of the Neuchâtel Asphalte Company in Berlin, I have been favoured with the following statistics:—

"The city of Berlin in round figures has a carriage-way area of about 4,500,000 metres, of which 1,500,000 metres are paved with asphalt and 65,000 square metres with wood. Taking the average street to be 10 metres wide (carriage-way), Berlin would have 450 kilometres of street way, of which 150 kilometres would be paved with asphalt."

According to the statement of the chief engineer of the

### ART PLATES.

PROOFS on Special Paper of the beautiful frieze, by P. V. GALLAND, which was commenced in our Special Double Number of January 3, can now be obtained on application to the Publisher. They consist of five pieces, as follows:—

**Architecture,  
 Stone Cutting,  
 Bricklaying,  
 Carpentry,  
 Joinery.**

The Plates are produced in a light artistic brown, with a gold background, and form one of the best decorative examples which have appeared for many years past.

The size of each Plate is Fifteen Inches wide by Ten Inches in depth. As only a limited number of proofs have been taken, early application should be made.

The price is Ten Shillings the set, free by post in patent roller.

**P. A. GILBERT WOOD,**

175 STRAND, LONDON, W.C.

A Complete List of Art Plates on Application.

Berlin Tramway Company, they have about 400 kilometres of tramway, and as it is mostly double line, you may say 200 kilometres of street way with trams are laid therein.

On the day after my arrival in Berlin I availed myself of an introduction which I possessed to Herr Dr. Hobrecht, the chief engineer to the municipality, and by him I was presented to Herr Baurath Gottheiner, chief of his staff, to whom is allocated the entire direction and control of the whole of the tramways within the municipal area. I learned from the last-named gentleman that the system which was being tried when I last visited the city of minimising the wear and tear of the paving material next the tram rails, viz., the placing on each side of the rail pieces of stone about 4 inches wide and of a depth equal to that of the rail itself, similar in fact to the edge curb used in London footways had been tried but without success; that these pieces of stone were being gradually removed and an altogether new system introduced.

This new system was mainly if not entirely dependent upon the absolute rigidity of the tram rails. No movement or vibration in them is permissible, and to effect that desideratum a rail is used of which I have made a sectional drawing.

From this it will be perceived that the depth of metal from the top of the rail to the underside of the bottom flange is 6 inches, that the width of the latter is  $4\frac{1}{2}$  inches, and the width at top, including the groove in which the flange of the wheel runs, is  $4\frac{1}{2}$  inches.

This rail is known as the "Phoenix." It is rolled at Osna-brück in Germany, and has been adopted in England. It is, in fact, the rail now laid down in the Theobalds Road, with one or two variations, but these variations are most important.

The rail used in England is 7 inches deep instead of 6 inches as in Germany, to suit the size of the granite sets in which it is embedded.

This extra depth is an advantage as tending to increase the solidity of the rail. In Berlin, however, the fish-plates for each length of rail are bolted together six times, whilst in London for the same length only four bolts are used. This to a large extent accounts for the extra rigidity of the Berlin rail as compared with the London one.

The method of placing the rails in conjunction with asphalt pavement is as follows:—The bottom flange of the rail rests upon a layer of mastic asphalt  $\frac{3}{4}$  of an inch thick, and the same material (mastic) 2 inches wide is placed next the upper flange and on each side thereof, the theory being that the mastic acts as a cushion or buffer, and receives the vibration (if any)

which may be occasioned by the passage of the tram cars or the ordinary wheeled traffic proceeding over the surface of the road.

I have shown in section the tram rails so laid in asphalt according to the system which now prevails in Berlin, and I have also prepared a drawing showing the manner in which the fish-plates are bolted together in the tramways recently constructed in that city.

The result of this method of dealing with the subject after two years' experience is most excellent. There is no disintegration of the asphalt next the edges of the rails, with the consequent destruction of the compressed asphalt forming the paving of the remainder of the roadway. But, as the Berlin engineers impressed upon me, everything depends upon the rigidity of the rails. Unless that can be obtained, the whole system fails; but I see no reason why that which has been accomplished in Berlin should not be accomplished in London.

Allowance must, of course, be made for the difference in volume of the street traffic of Berlin and that of London. It is almost unnecessary to say that the traffic of the former city, though by no means small, does not even approximate to that of the latter, either as regards the number of the vehicles or the weights carried therein. The driving pace is more sharp in Berlin than in London.

Private as well as hackney carriages are driven in Berlin at a pace which in London would render those concerned amenable to a charge of furious driving to the common danger of both vehicular and pedestrian traffic.

Reverting to the requisition or memorial of the inhabitants of Theobalds Road, and assuming for the moment that it is practicable to lay tramway rails in asphalt without consequential destruction of the paving material, we have now to address ourselves to the consideration of the question, How is it possible under existing conditions to effect the change in the Holborn district, say, for a commencement, in Theobalds Road?

The conditions under which tramways are laid down in Berlin and London are widely different. In Berlin the municipal authority is supreme.

It can and does control the original construction and the subsequent maintenance of the tram rails, and the paving in juxtaposition therewith, absolutely and without appeal from any of its decisions in regard thereto. Needless to say a very different state of things prevails here.

## THE WELL-KNOWN FRIEZE, ENTITLED "THE CORN FIELD."

A SPLENDID EXAMPLE OF COLOUR-WORK IN PERMANENT INK PHOTO, BY  
**M. PAUL ALBERT BAUDOIN.**

*This magnificent Illustration was presented to the Subscribers to "The Architect" in 1886. A few Proofs were taken, which immediately became out of print.*

### OPINIONS OF THE PRESS.

"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition is being issued."—THE LADY'S PICTORIAL.

"They are beautifully done in colours by the permanent ink photo process, and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—THE STAGE.

"The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour-work in permanent ink photo, by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic, and would grace the walls of any house."—THE GENTLEWOMAN.

—AND NUMEROUS OTHERS.

In consequence of the almost daily demand for these Plates, they have been reproduced by Subscription at Half a Guinea the Set, and are now ready for issuing.

**P. A. GILBERT WOOD, 175 STRAND, W.C.**

*May be had framed in Solid Oak Frames with Mounts, at Three Guineas the set of Five Plates.*

I have reason to believe, however, that the North Metropolitan Tramways Company, to whom the line in Theobalds Road belongs, would not be indisposed to meet in an equitable spirit any approach on the part of this Board to effect a change in the paving of that road which would lead the frontagers no longer to look upon the tramway as the cause of a nuisance which is fast becoming unbearable.

A most desirable alteration of the existing conditions as to the maintenance of the street-paving could also be effected.

Instead of having, as now, two authorities over the maintenance of one roadway, terms might be arranged under which the sole charge of the road surface, excepting of course the tramway rails, should be vested in this Board. Then would disappear the anomaly now existing that the road authority is dependent upon the co-operation or otherwise of a trading company, whether the paving of the roadway in which a tramway is laid is to be maintained in a proper condition for ordinary vehicular traffic or otherwise.

I have received a letter from the chief engineer to the municipality of Berlin, of which the following is a translation:—Municipal Buildings, Berlin: January 28, 1897.

With reference to the interview which you had with Mr. Gottheiner, architectural councillor, we beg to confirm that since 1880 tram-lines have been paved very extensively here and in many of our main arteries of traffic, such as, for instance, Leipziger-Strasse, König-Strasse and Friedrich-Strasse, with asphalt pavement, and we have not so far had any cause to think of abandoning this system. Up to a very few years ago the building-in of the rails into the asphalt pavement was effected by facing the rails on either side by granite sleepers, 15 to 16 centimetres wide by 15 to 17 centimetres high, and bringing the compressed asphalt up to this edging of stone. The tramway company—who, according to the existing agreements, are bound to maintain this pavement within and between the rail tracks, as well as to a width of 70 centimetres on either side beyond the metals at their own expense—requested us three years ago to dispense in future with the granite bordering along the rails, and to have the asphalt covering brought up immediately against the rails. As, in view of the great extent of asphalt paved roads, the maintenance of the old arrangement proved very expensive, and as in consequence of the introduction of a more substantial and firmer tramway superstructure, this ar-

range ment was no longer required. In the case of siding-points and tramway crossings only the bordering with stone sleepers would be adhered to in future, because in these parts of the structure it was not feasible to insure the same amount of stability as in the case of ordinary rails, but, on the other hand, the company proposed to increase the dimensions of the stone bordering in these cases from 19 to 20 centimetres in width and from 17 to 18 in height.

We agreed to this proposal with the proviso that in future until further notice we should dispense with the use of stone borderings wherever an iron superstructure system, with a rail 15.5 centimetres high, and laid on the system of alternate or non-coincident rail-joints is used. We have, moreover, permitted the tramway company, should they think it desirable, to join the asphalt pavement to the rail by a narrow strip of mastic instead of compressed asphalt.

We beg to remark, in conclusion, that according to the experience hitherto gained, dispensing with the stone edging and carrying the asphalt immediately up to the rail itself has not given rise to any inconvenience or complaint.

Lewis H. Isaacs, Esq., Chief Engineer,  
Holborn Town Hall, London, W.C.

I cannot close this report without expressing my sincere thanks to the chief engineer of the municipality of Berlin and to the head of his staff, as also to the engineer of the elder and larger of the two tramway services in that city, "Die grosse Berliner pferde Eisenbahn," for their courtesy and kindness in placing at my disposal all the models and drawings in their possession, to illustrate the many points upon which I sought information.

So far from deeming it a trouble they took pains to assure me they considered themselves flattered by a visit from an English architect and engineer, with the object of being advised and assisted by them in a matter of such great public importance.

#### INSTITUTION OF MECHANICAL ENGINEERS.

THE annual meeting of this Society was held on the 4th inst. in the hall of the Institution of Civil Engineers. Mr. E. Windsor Richards, president, was chairman. The President was re-elected, and the names of Mr. Edw. P. Martin, of Dowlais, and

ILLUSTRATED CATALOGUE FREE.

Mr. J. Hartley Wickstead, of Leeds, were added to the list of vice-presidents. The annual report of the Council disclosed the vigorous prosperity of the Institution. The total of members (2,360) is 89 in excess of the previous year, and during 1896 there have been added to the register 183 names, against the diminution by deaths of 27, and 67 resignations. During the past year baronetries have been conferred by Her Majesty upon Sir William Coddington, M.P., and Sir William T. Lewis (members); and the Council have nominated Professor Unwin, F.R.S., an honorary life member of the Institution, in appreciation of his eminent position as a representative of scientific engineering. The accounts showed receipts during the year of 7,388*l.*; the balance of receipts over expenditure, actual and estimated, leaving a sum of 2,173*l.* in hand. The capital of the Institute, allowing 600*l.* for accounts not yet rendered, amounts to 46,000*l.* Of this, 24,000*l.* remains invested, mostly in railway debentures, while 16,000*l.* has already been expended upon the Institute's house, now in process of erection at Storey's Gate. The foundations have been put in, and the superstructure will be proceeded with as soon as the requirements of the Office of Works and of the London County Council have been settled.

The report by Professor Roberts-Austen to the Institute's research committee, on alloys, was read. It dealt for the most part with the copper-zinc series known as brasses, which possess so much industrial importance, and afterwards it dealt with certain relations between the fusibility and strength of alloys involving considerations as to the constitution of alloys generally. An account was further given of the experimental investigations which had been undertaken with a view to measure the molecular mobility of solid and molten metals known as diffusion. Certain improved results in the recording pyrometer, rendering it more sensitive, were lucidly described. The value of the experiments on the nature and properties of alloys which were originated by the Institution in 1890 has received widespread recognition, and it may be fairly claimed that they have stimulated similar work in France in a remarkable way, as also in Germany. Professor Roberts-Austen's report dealt with many intricate subjects in a masterly way, and settled many questions that were previously greatly involved. That the mechanical properties of metals and alloys are connected with their atomic volumes was definitely answered in the affirmative. The diffusion of metals in metals occupied many passages of value, the experiments having led to the recognition of the remarkable

fact that the diffusion of metals can be readily measured, not merely in molten but also in solid metals. An appreciative discussion was opened by Sir William Anderson, and actively continued by some of the leading members.

### PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

### APPLICATIONS FOR PATENTS.

1915. Hiram Waddington, for "Improvements in water-closet seats."

2047. Wilhelm Beielstein, for "Flushing apparatus, with movable syphon for water-closets."

2089. Reginald Haddan, for "Improvements in tool-holders for metal planing and cutting machines."

2097. Charles Burley and Charles Burley, Jun., for "New or improved tools or appliances for facilitating the machining of the lugs, bottoms, brackets and the like of bicycles."

2143. Thomas Frederick Lees, for "A new and improved holed firebrick for heating furnaces."

2184. James Alexander Drummond, for "An improved method of and means for securing plate and sheet glass to walls, ceilings, bricks and other surfaces."

2195. Alfred Suant and George Washington Robertson, for "Improvements in apparatus employed in the manufacture of paving bricks or tiles."

2302. William Hewitt, for "Improvements in apparatus for the manufacture of tiles."

2400. William Johnstone Jeffrey and John George Mowbray, for "Improvements in the backs of tiles, bricks, briquettes and the like made from clays or other materials."

**FOR SOLID PLASTER PARTITIONS**, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

**FOR FIREPROOF LATHING**, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

**FOR CONCRETE FLOORS WITH EXPANDED METAL**.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

**FOR EXTERIOR WALLS OF BUILDINGS**.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

**FOR FENCING, TREE GUARDS, WINDOW GUARDS**, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

**ORNAMENTAL. STRONG. CHEAP.**

**OTHER USES FOR EXPANDED METAL**.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away.

Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

**BRASS, ALUMINIUM**, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

**CATALOGUES AND PRICE LISTS** can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

## EDITORIAL NOTICES.

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

## NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

*For Advertisement Scale, see page xiii.*

**BUILDING AND BUILDERS.**

THE Moseley Presbyterian congregation are about to erect a new church and lecture hall on a site at the corner of Chantry Road, at a cost of 6,000*l.*

A NEW church is to be erected at Burley, Leeds, at a cost of about 6,000*l.*

THE foundation-stone of a new synagogue for South Hackney, which is to be erected in Devonshire Road, Mare Street, at a cost of 7,300*l.*, was laid on Sunday by the Hon. Walter Rothschild.

A NEW hospital is to be erected in Blair Street, Coatbridge. It is to be called the Alexander Hospital. The plans, which have been passed, were prepared by Mr. A. M'Gregor Mitchell, architect and burgh engineer, Coatbridge, and show a handsome set of buildings in the Old Scotch Baronial style of architecture. The cost will be about 8,500*l.*, and there will be thirteen beds for patients meeting with accidents in the districts of Old and New Monkland and Shotts. The buildings will cover 1½ acre of ground near Gartsherrie and Drumpellier Station, N.B.R., and will include nurses', doctor's, convalescent, &c., rooms.

## ELECTRIC NOTES.

MR. F. J. WARDEN-STEVENS, A.M.I.E.E., has made a careful examination of the electric-light installation at the Bishopsgate Institute, for the purpose of advising as to a means of reducing the annual cost, which is considered excessive. He has fully investigated the matter, and submitted an exhaustive report to the Governors. This was read at a recent meeting, the surveyor, Mr. D. R. Dale, being present. Several comments were made and general approval expressed, the chairman stating that it was an admirable report, and that the matter had been very thoroughly gone into.

THE Local Government Board have sanctioned the borrowing by the West Ham Town Council of 50,000*l.* for their electric-lighting scheme.

THE lighting of the St. James's end of Pall Mall by electricity is a complete success, and Marlborough House, hitherto a very dark corner, receives the full benefit of the new illuminant.

IN Manchester men are busily engaged erecting in Albert Square four large iron standards from which the electric light will shine, and if the experiment proves successful eight more standards will be put up in the Square. Ultimately, no doubt, gas as a street illuminator will be completely dispensed with.

THE electric-lighting committee of the Edinburgh Town Council, at a meeting held on the 16th inst., considered a motion by the convener, Councillor Mackenzie, on the subject of the charge to be made for electric lighting in the city. The committee agreed to recommend that the charge for the light, as from May 15, should be 4*d.* per unit, a reduction of 1*d.*; that the charge for each public lamp should be 16*l.* per annum instead of 18*l.*, and that the charge for motor power should be 2½*d.*

## TRADE NOTES.

THE Isolation Hospital, Ilford, is being warmed and ventilated by means of Shorland's patent Manchester grates, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

MESSRS. EASTON, ANDERSON & GOOLDEN, LIMITED, Whitehall Place, S.W., and Erith, Kent, are about to erect five lifts in the new Duke Street block of Messrs. Spencer, Turner & Boldero's new warehouses in Lisson Grove.

FOR the ventilation of the Girls' Intermediate School, Abergavenny, Mr. E. A. Johnston, architect, Messrs. Cousland

& Mackay's ornamental Design S "Climax" patent direct-acting louvre ventilator has been used, and supplied from their works at Glasgow.

MESSRS. JOHN KNOWLES & CO. draw our attention to the fact that the "Vitrifine" stoneware drain-pipes which the firm supplies are tested by internal hydraulic pressure up to 30 lbs. per square inch, which is equal to 70 feet head of water.

AT Mossley Hill Church, Liverpool, a large Cambridge quarter clock, showing the time upon two external dials, and striking the hours upon a bell of two tons and quarters upon four smaller bells, was set going by Miss Robinson, the donor, on Monday evening last at 6 o'clock. The clock was made and fixed by Messrs. W. Potts & Sons, of Leeds and Newcastle, from specifications prepared by Mr. R. Bushell, Liverpool. The clock has Lord Grimthorpe's gravity escapement and maintaining power compensation pendulum beating 1½ second, with 500-lb. pendulum bob and all the latest improvements inserted.

## VARIETIES.

A NEW Wesleyan church has been begun at Exmouth to hold 700, and to cost over 6,000*l.*

A NEW Baptist church has been opened at East Greenwich. The building is to take the place of a temporary structure which has been used since 1892.

A NEW church erected at Box by the Free Methodists has been opened by Lady Poynder.

A NEW Congregational church, providing accommodation for 400 persons, has just been opened at South Wigston, Leicester. The cost has been 1,600*l.*

THE great north transept window in Doncaster parish church, which was destroyed by a gas explosion some time ago, has been filled with new stained-glass illustrative of the "Te Deum."

THE People's Palace of Varieties, Aberdeen, in which a fatal fire occurred in September last, is to be at once rebuilt, and Mr. John Rust, architect, has been commissioned to accept tenders for the building amounting in all to 10,000*l.* The hall will be erected on the site of the old building in Bridge Place.

THE next meeting of the Institution of Civil Engineers will be held on Tuesday next, the 23rd inst., at 8 P.M., when a paper will be read with a view to discussion on "The Main Drainage of London," by Messrs. J. E. Worth and W. Santo Crimp, M.Inst.C.E.

ESTABLISHED 28 YEARS.

A COMMODIOUS school building erected in Upper Lloyd Street, Manchester, by the Moss Side School Board was opened on the 12th inst. The cost of the new building, with accessories and the needful preparation for future extension, has been about 8,500*l.*, and the completed scheme will only add about 1,000*l.* to that sum.

THE Metropolitan Machine Company have just opened a handsome new riding school in the City in the rear of their well-known Bishopsgate works and showrooms. This great acquisition to the cycle-learning facilities of the Metropolis will make the "Juno" firm more popular than ever in the ever-growing cycling world.

THE directors of John Oakey & Sons, Limited, propose a final dividend upon the ordinary shares of 5 per cent. for the half year ending December 31 last, together with a bonus of 2½ per cent., making 12½ per cent. for the year; to pass 8,500*l.* to reserve, making that fund 26,234*l.* 16*s.* 10*d.*; and to carry 198*l.* 14*s.* 7*d.* forward to next account.

WITH reference to the artesian well at the Sleaford Station of the Great Northern Railway, noticed in our last week's issue, we now learn that this well, which has been bored by Messrs. Le Grand & Sutcliffe, of London, is 150 feet deep and overflows at 6 feet 6 inches above the ground. The flow of 14,400 gallons per hour was taken at 3 feet above surface, but the actual overflow at surface level is no less than half a million gallons per diem.

THE Leigh Council having decided to separate the offices of clerk and surveyor, over ninety applications have been received for the surveyorship, which is worth 300*l.* per annum, increasing to 350*l.* in three years and to 400*l.* in six years. The applications include well-known Manchester, Liverpool and Bolton gentlemen and surveyors from other Lancashire towns, the Isle of Wight and South of England being also represented.

THE county of Carlow having, in the opinion of the authorities, no further use for a gaol, it was on the 19th inst. put up for public sale by order of the grand jury. The premises comprise debtors' prison, convict prison containing thirty-four cells, female prison of thirty cells, house of correction, treadmill, pump and "fine-cut granite gate entrance." After an animated competition Mr. Molloy, a local merchant, was declared the purchaser at 1,200*l.* It was rumoured that the purchase has been made in trust for some Roman Catholic purpose, probably an industrial school.

A MEETING of the Association of Parochial Engineers was held on the 9th inst., Mr. A. Saxon Snell, F.R.I.B.A., occupying the chair. Mr. T. W. Smith read a paper on the above-named subject, giving in the first place a brief account of the old system for the disposal of refuse, and pointing out the dangers which the public health encountered. He then dealt very exhaustively with the merits and demerits of the refuse destructors of modern days. He also described the method of working the destructors, and pointed out that a good revenue was to be obtained from the sale of the "clinkers." The paper was followed by a discussion, in which Mr. House, of St. Luke's Vestry, and Mr. Spom, of Kensington Vestry, joined.

THE new Customs outlook station in Glasgow Harbour has been completed, and is now in working order. The station-house, which is situated on Mavisbank Quay, immediately to the east of Stobcross Ferry, is a prominent feature on the south of the harbour, and its design is so uncommon as to attract the attention of the thousands of people whose business takes them up and down the harbour. It stands about 40 feet from the face of the quay, and a piled foundation had therefore to be provided for the front and end walls. The building is two storeys in height, and overhead is a look-out room, 20 feet by 12 feet, with numerous windows, from which the officers on duty command the whole river up and down. On the ground floor are the kitchen, the examining officers' office, the surveyor's office, the storeroom and the lavatory; and on the first floor the boatmen's dormitory, the preventative officers' office, the preventative officers' dormitory, the chief preventative officer's office and the cloak and lamp-rooms. The exterior walls are of first quality fine-pressed red bricks, with red sandstone base-course, projecting corners and window and door sills, lintels and rybats.

AT a meeting of the improvement committee of the Gloucester City Council plans of a new theatre and opera-house, which a London syndicate are about to erect on the site opposite the municipal schools in Brunswick Road, were submitted and passed. The plans, which have been prepared by Mr. John P. Briggs, of Effingham House, Arundel Street, Strand, disclose a handsome and imposing building of brick and terra-cotta. Seating accommodation will be provided for 1,500, and from each seat there will be a clear and uninterrupted view of the stage. The latest lines have been followed in regard to comfort, exits, electric lighting and ventilation, and without doubt the theatre, when completed, will compare favourably with any house in the provinces.

## NEW CATALOGUES.

MESSRS. EDISON & SWAN have sent us one of their new illustrated price-lists of electric fittings, holders, switches, &c., of which they keep a large stock at their central warehouses, Ediswan Buildings, 56 and 37 Queen Street, London, E.C.; the West End dépôt, 53 Parliament Street, Westminster, S.W.; and the various provincial dépôts. The book is well printed on excellent paper, profusely illustrated, and forms a useful compendium of knowledge as to the various appliances for and accessories to electric lighting.

## ASPINALL'S ENAMEL.

ASPINALL'S ENAMEL, LIMITED, are usually considered solely as manufacturers of enamel, put up in tins and tinlets, but it is an egregious error to suppose that the firm confine their attention to this branch of business, extensive as it is. They have enamel suitable for every description of decorative work, both inside and outside, and we recommend everyone who wants an article with an easy flow, and something which is not difficult to work with the brush, to apply for samples of their "O" quality. With paints and varnishes, quality has been, and always will be, the main thing considered by Aspinall's Enamel, Limited. With a tin bearing the label of New Cross Brand, one is sure of a paint of the highest grade. All their varnishes are guaranteed "genuine gum varnishes," and the increased turnover in this particular article testifies to the appreciation of their *clientèle*. Perhaps the most remarkable of their recent successes is "Wapicti," a washable distemper combining the properties of a strong disinfectant and antiseptic agent. Wapicti dries with a dull flat surface, similar in effect to fresco painting, and it can be had in such a charming variety of

colours as to enable ambitious decorators to attempt Pompeian effects, or, harking still further back, Assyrian combinations of rich and brilliant hue. Wapicti is invaluable for interior decoration of living rooms, kitchens, passages, sculleries, wash-houses, &c. We cannot be too careful in the decoration of the walls of dormitories, hospitals, barracks, &c., and one pays far too little attention to the question of a healthy or unhealthy wall-paint or paper. There is nothing obnoxious in Wapicti—in fact, its disinfectant qualities alone recommend it, and its delicate tints and its artistic effects render it the desideratum of the decorating trade. Wapicti may be applied over oil paint without clear-colling, or oil paint may be laid over it.

THE PATENT VICTORIA STONE COMPANY,  
LIMITED.

THE ninth annual meeting was held on Saturday last at the Great Eastern Hotel, Bishopsgate Street, Mr. J. J. Griffiths, the chairman, presiding. In his address the chairman said the volume of business transacted during the year exceeded by 20,000% the amount done in any previous year. The profit earned was 9,779%, against 7,176% in the previous year, an increase of 2,611%. They were now making great advances in the way of architectural work, which was becoming an important feature of the company's operations. The beautiful specimens of carved architectural stone shown in the room opened up a new field for profits, and as the material was capable of holding its own in any position, in any climate, and for any length of time, he thought it could not fail to add to the company's business in future. The directors had acquired the sole agency of the National Opalite and Glazed Brick and Tile Syndicate in two of the principal counties in the Midlands, and had made arrangements to buy five acres of land at Groby for the purpose of erecting cottages for their workpeople. Many of their workmen were unable to get house-room within four or five miles of their work, and the directors proposed to build suitable cottages, and to offer easy terms to their workmen to purchase cottages or plots of land for building. The directors, he added in conclusion, had decided to call up the balance of the capital—20,000%—and to offer the new shares to the existing proprietors at par. Mr. James Glaisher having seconded the motion, Major Lewis H.

Isaacs strongly objected to the issue of the new shares at par. The second and third issues, he pointed out, had been made at a premium of 17., and if the same course was adopted now they would obtain 4,000% towards the acquisition of land for building purposes. He moved an amendment to the effect that the new shares should be issued at 17. premium. The amendment was rejected, only three hands being held up in its favour, and the motion for the adoption of the report was carried unanimously. On the motion of the chairman, seconded by Major Isaacs, a dividend at the rate of 10 per cent., free of income tax, was declared. Mr. James Glaisher and Mr. W. T. Douglass were re-elected directors, and Mr. James Aynsley was reappointed auditor. The proceedings closed with a cordial vote of thanks to the chairman and directors.

### THE COUNTY COUNCIL BUILDINGS, LONDON.

At the instance of Major-General J. Shaw Stewart, R.E., the following resolution was unanimously adopted by the Paddington Vestry at its meeting on the 16th inst.:—"That, in the opinion of this vestry, the scheme proposed by the London County Council, and at present before Parliament, for erecting new Council buildings for London, is a highly extravagant project; and, should it be considered necessary to have new buildings, this vestry strongly urges upon the Council the expediency, before deciding upon any site, of ascertaining by public advertisement and by every other possible means what suitable sites within the metropolis are available, and the terms upon which they can be secured." Mr. Frank Dethridge, the vestry clerk, was directed to send a copy of this resolution to the Paddington borough members and to the vestries and district boards of the metropolis, with a request to the former to oppose the Bill now before the House of Commons, and with an invitation to the latter to pass a similar resolution to that adopted by the Paddington Vestry.

MESSRS. GRAHAM & BANKS' tender of 303% for decorating the new supper-room at the Royal Palace Hotel, Kensington, has been accepted by the directors, and the work is to be done under the architects, Messrs. Henry S. Legg & Son, of Christ's Hospital.

### NOTTINGHAM MASTER BUILDERS' ASSOCIATION.

THE members of the Nottingham Master Builders' Association held their annual dinner at the Albert Hotel, Derby Road, on the 13th inst. There were about seventy in the company, and the proceedings were characterised by much enthusiasm and success. Supporting the chairman were Mr. James Wright (the vice-chairman), Alderman C. Bennett, Councillor John Wright, Messrs. G. Fish, J. Sulley, H. Vickers, J. W. Woodsend, J. H. Williamson, W. Edgar, F. Hodson, Chambers (the vice-president Leicester Association). Others present included Messrs. H. Green, A. H. Niblett, J. H. Vickers, Simpson, Whittaker, W. Watson, W. Wootton, Whitehouse, Fish, F. Atkin (retiring secretary), W. J. Barton (secretary), A. G. Bell, J. Cowper, S. Cook, T. Cuthbert, T. Day, F. Evans, Garton, Burton, H. C. Gilbert, Gabbitass, H. Haines, A. Hinsley, Hobson, J. Hutchinson, E. Kent, J. Lewin, G. T. Lovett, Whitworth, W. Maule, F. Messom, Norris, Pillatt, Poyzer, Priestley, Price, Rudd, W. Savage, F. Shaw and W. Hall.

### MUNICIPAL OFFICERS' ASSOCIATION.

THE annual dinner of the Municipal Officers' Association promises to be a great success, not only in point of numbers, but of its thoroughly representative character; municipal officers coming from all parts of the country. The Right Hon. the Lord Mayor of London, the president of the Association, will be well supported. Amongst those who have promised to attend we notice the Right Hon. Lord Balfour of Burleigh, Chief Secretary of State for Scotland, Sir John Blundell Maple, M.P., J. L. Wanklyn, M.P., Mr. C. J. Stewart, Clerk to London County Council, Sir John Monckton, Town Clerk of London, Mr. H. H. Crawford, the City Solicitor, the town clerks of Birmingham, Crewe, Devonport, Douglas (Isle of Man), Huddersfield, Lancaster, Bootle and Nelson, and amongst the London vestry clerks Mr. M. H. Hale (hon. solicitor to the Association), Holborn, Mr. C. William Tagg, Camberwell, Mr. W. M. Mead, Bromley St. Leonard, Mr. G. W. Preston, St. Luke's, Mr. F. Dethridge, Paddington, Mr. A. P. Johnson, Southwark, also Mr. J. H. Rutherglen, Mr. O. S. Brown, surveyor of Camberwell, Dr. Stevens, medical officer of health, Camberwell, Mr. G. A. R. Fitzgerald (standing Parliamentary counsel), Mr. G. Attenborough, accountant to School Board for London, Mr. F. Sumner, surveyor of Bermondsey, Mr. R. H.

### THE CONDITION OF DUBLIN.

At the meeting of the Dublin Sanitary Association on the 11th inst., Dr. Duffey, president of the Royal College of Physicians, said the state of the public health in Dublin since the beginning of the present year had, to say the least of it, been very unsatisfactory. He did not wish to be an alarmist, and he agreed with the superintendent medical officer of health in the opinion he expressed that there was no necessity for a scare. But at the same time he thought it would be injurious to minimise the gravity of the present situation, or to seek by any plausible explanation to discount the excessive mortality which existed. They were now in the midst not only of one epidemic, the epidemics at present were now at least four—preventable diseases, to say nothing of the enteric fever, which unfortunately was always more or less present amongst them. During the week ended January 30 last he found that the death rate in this city was 50·2 per thousand persons living. The zymotic death rate was 9·2 per thousand. He might mention that in London the death rate this week was a little over 20 per thousand, and the average zymotic death rate was, he believed, about 2 per thousand. They could see the great difference between these figures. They had been officially informed that the present high death rate existed from preventable disease, and was chiefly due to its being spread widely through the infantile population, and that—he was now quoting—"because since 1892 there had been few deaths," he presumed "cases" was meant, "from measles, scarlet fever, or whooping cough, and therefore few children under four years had been protected against these diseases by previous attacks." Surely it was also small comfort to be told by the same authority that at no distant date the epidemics would have died out. Were they to understand that that would take place because there would be no persons left to be

attacked, or that there would be no more pabulum for the disease to feed upon? Instead of letting them die out should they not make some attempt to stamp them out? What warranty had they for the rather vague assertion that these diseases would in all probability not again arise in epidemic form? The want of adequate hospital accommodation for infectious diseases such as those in the present instance amongst them, the absence of means of isolation for the families amongst whose members infectious diseases might occur, and the deficiency of provision for convalescent hospitals for such cases were, they well knew, very potent factors for the spreading of these diseases. Past experience showed that it was chiefly by stimulating official perfunctoriness and bureaucratic indifference that they were able to get the legislative powers that existed—small as they were—put into force for the preservation of the health of the people. It was by constantly drawing attention to those matters requiring sanitary reform and educating the people in the elementary rules of public health that the Dublin Sanitary Association was doing its important work which deserved general support. Referring to the proposed convalescent hospital at the Pigeon House, he said he was rather surprised to have seen it stated that he gave an opinion that was diametrically opposed to that of the Council of their Association. The only remark he remembered having made on the matter was in a private conversation with a medical man in talking of the healthiness of the site, which was a different thing from the establishment of a convalescent hospital there for patients recovering from scarlet fever. He remembered saying that after some experience of the Pigeon House Fort thirty years ago or more, when he was a surgeon in the Army Medical Department some men of his regiment and their families were there, and as far as he knew it was a healthy quarter. He did not wish in any way to put his opinion against the opinion of the Council of the Association.

Dr. Grimshaw, Registrar-General, spoke of the present high death rate in Dublin, especially of the deaths caused by measles. In 1892 this disease caused 472 deaths, and if every five years they were to have such an epidemic, the matter was very serious. The fact of the matter was that the sanitary condition of the city was not what it ought to be. They had still streets of wretched tenement houses crowded together in various places, and they had inadequate accommodation for the treatment of infectious diseases. Excessive drinking and dirt had got more to do with the high mortality than any other two elements. But to say that it was only the children who

445 OXFORD STREET, LONDON, W.

were dying was the worst statement that could be put forward. The children were the very people who should be taken care of. They would ultimately be the citizens if they were allowed to live, but, unfortunately, they were not in Dublin, and their population was practically at a standstill. It was a very serious matter. The only place in the world that beat Dublin in the matter of death rate was Bombay. According to the last return the rate in Bombay was 102 per thousand, but there was no place else in the whole world that he could find in the records that came to his office that came near the death rate which they had reached in the city of Dublin. Last week it was 49·8 per thousand within the city. It was something appalling, and something which had occurred very seldom here before, and was a cause for alarm, and very serious alarm indeed. It was preposterous to try to minimise the high death rate by saying it was only the children that were dying.

### WORKMEN'S DWELLINGS IN MANCHESTER.

THE sanitary committee of Manchester have for some time been considering proposals for utilising for the purpose of tenement dwellings and cottages for working men a number of building sites now in possession of the Corporation. The city surveyor in his report says:—"The total number of persons to be housed is 2,584. The sites known as the 'Oldham Road area' and 'Pollard Street area' are to have buildings so constructed as to contain in the aggregate not fewer than 2,034 persons. The Oldham Road area is divided into two building sites of nearly the same size. Tenement dwellings of five storeys have been erected upon the east portion of the site between Spittal Street and Bengal Street. These dwellings contain 235 double rooms and 48 single rooms and accommodate 848 persons. The remainder of the site between Spittal Street and Cornwall Street is available for the erection of additional buildings. The Pollard Street area is covered by tenement dwellings very similar to those that have been erected on the Oldham Road area. These dwellings consist of 130 double rooms and 5 single rooms, and accommodate 448 persons; this leaves a balance of 738 persons still to be provided for on the Oldham Road area. Three hundred persons are to be housed on the Chester Street area and 250 persons on the Pott Street area, making a total of 1,288 persons still to be housed." In order to obtain accommodation for this number of persons without having recourse

to high buildings similar to those already erected, the city surveyor has examined the other sites belonging to the committee which may be utilised for the erection of labourers' dwellings. A plan is given which shows the position of five building sites situated in Oldham Road, Chester Street, Pott Street, Harrison Street and Pryme Street. The railway stations, tram routes, and the distances of the sites from Albert Square are indicated on this plan. With regard to the Oldham Road area, the plan adopted provides for buildings to front Oldham Road four storeys in height, and to consist of thirteen shops and dwelling-houses, with frontages varying from 19 feet 3 inches to 29 feet 6 inches. The first, second and third storeys would consist of five-roomed dwellings connected with the shops. The buildings on the remaining portion of the site would consist of two rows of two-storey tenement buildings, fronting to a new 12-yards street, and one row of five-roomed cottage dwellings, fronting to George Leigh Street, which is 18 yards wide. The clear space between the buildings at the rear would vary from 58 feet to 55 feet in width. The four rows of buildings would afford accommodation for 377 persons. The estimated cost of erecting these buildings is 17,901*l.*, equal to 36*l.* 15*s.* 3*d.* per person. The estimated cost of sewerage and paving the new streets, exclusive of the cost of widening the existing streets, is 900*l.*, to which must be added the estimated value of the site, viz. 7,981*l.*, or a total of 26,782*l.* On the Chester Street area it is proposed to erect four blocks of buildings, with frontages to Chester Street, Marsland Street and Hulme Street. The buildings would be two storeys in height, and each dwelling would consist of two two-roomed and two three-roomed tenements. These buildings would afford accommodation for 306 persons. The estimated cost of these four blocks is 11,873*l.*, equal to 38*l.* 16*s.* per person, and the estimated cost of new streets, exclusive of street improvements, is 350*l.* The estimated value of the site, which has an area of 4,554 yards, is 2,277*l.*, or a total of 14,500*l.* An alternative scheme is submitted. On the Pott Street area it is proposed to erect two blocks of four-storey tenement dwellings, of a similar character to those already described for the Chester Street area. The buildings would accommodate a total of 400 persons. It is proposed to widen Pott Street, Sandford Street, Caroline Street and Wharf Street, making the width of these streets in each case 14 yards. The estimated cost of the buildings is 15,357*l.*, equal to 38*l.* 7*s.* 10*d.* per person, and the estimated cost of new streets, exclusive of street improvements, is 164*l.*

Samples can be seen at Duff & Spagnoletti's London Showrooms.

The estimated value of the site, which has an area of 3,914 yards, is 1,957*l.*, or a total of 17,478*l.* The committee recommend the Council to approve of and authorise (subject to the sanction of the Local Government Board) the erection of a model lodging house in Harrison Street, in general accordance with the sketch plans prepared by the city surveyor. Certain proposals contained in the report of the city surveyor with respect to Pryme Street were withdrawn. The number of persons to be accommodated by the schemes recommended for adoption is 1,346.

### LONDON WATER SUPPLY.

In a letter to the *Times* Sir Frederick Bramwell, C.E., writes:—

I presume it will not be long before Parliament will, again be considering this matter, with the object of once more determining whether or not the undertakings of the water companies now supplying London should be compulsorily acquired by the London County Council, in conjunction, it may be, with certain outside authorities as regards portions of the undertakings.

I was under the impression that hitherto the County Council had always put forward the desirability of the whole water supply being in the hands of one authority, but it would seem they have now altered their views upon this point, and are prepared to agree to county councils many and to authorities many.

According to my view, if the inhabitants of the Metropolis were wise, they would leave the undertakings in the hands of the companies who for years past have given a supply to those inhabitants the excellence of which is proved by the health of the people, as testified in the weekly returns of the death-rate of London and of some thirty or more of the principal towns in England.

There are eight companies engaged, each of them supplying a population sufficiently numerous as to well warrant an independent organisation for the control of its district; but it might possibly be found on inquiry that an improvement could be made by combining the eight companies into two undertakings, one for the north and the other for the south side of the Thames. If such a change were made it might also be well, in order to satisfy public opinion, to add certain persons holding public position (the fewer the better) as *ex-officio* members of the boards. But if the sentiment that the water-supply should be in the hands of some public body, and not in those of private

companies, be so strong that Parliament feels the companies must be displaced, then, in the deepest interests of the ratepayers of London, I do trust that Parliament will not for one moment allow the companies to be acquired by the London County Council, and I urge this for the following reasons:—

It cannot be the desire of any honest person that the holders of stock in the present London water companies should be deprived of their property without fair and full compensation for that in which they originally invested, or into which they have entered by subsequent purchase, in both cases on the faith of Parliamentary bargains.

Assuming the change to be made from the companies to some newly-constituted water board, it may be taken that such a board would seek to utilise to the utmost that which it had purchased, namely, the undertakings and sources of supply of the present companies; but the London County Council is committed to a policy of a change of supply—that is to say, if the London County Council became the purchasers of the companies the ratepayers of London will have to pay not only that which they ought to pay to compensate the proprietors, but at least as much more—which there is no need to pay—for the provision of new sources of supply.

A most competent Royal Commission, composed of representative men in engineering, chemistry, geology and medicine, and presided over by Lord Balfour of Burleigh, came to the unanimous conclusion, after hearing all parties, that the existing London water-supply is a perfectly wholesome one, and, as I have said, the weekly returns of the death-rate show that this is so.

The London County Council set up their opinion in opposition to that of the Commission and to the records of the death-rate. But I presume one may say without offence that the London County Council are not infallible, and it seems to me it would be most regrettable if the water-supply of London were to be acquired by this body with the object, not of using the sources of supply, but of discarding them, thereby once more, be it stated, involving the ratepayers in an enormously increased annual charge for water.

Take a striking instance of what would happen. The Commission approved of a plan brought forward by Mr. Walter Hunter and the late Mr. Fraser, on which plan Mr. Hawksley and I reported, by which, in the neighbourhood of Staines, large reservoirs were to be provided, the provision to be made as and when wanted, to impound the excess waters of the Thames and to deliver them to the water companies at times

when the flow of the Thames was comparatively small. Last year Parliament sanctioned the first instalment of this scheme, promoted jointly by three of the water companies, and the work is just about to be begun.

The Commission recognised that the average daily flow of the Thames was some 1,300 million gallons, and that, therefore, after providing for the requirements of the navigation there was an enormous volume of water which now went away uselessly to the sea, while, by means of reservoirs, it might be impounded and be beneficially used.

In the Parliamentary committee which inquired into this Bill the counsel of the London County Council said that the passing of the Bill "will make the abandonment of the Thames as a source of supply—a policy which, rightly or wrongly, has been decided on by the County Council, and which will ultimately commend itself to everybody in London—much more difficult."

If therefore this year Parliament puts the London County Council into the position of being the owners of the London water-supply, they should logically put a stop to these works.

I may, perhaps, be told that the London supply has not been satisfactory from the point of quantity, and reference may be made to the difficulty experienced in 1895, during the many weeks of continuous frost, and in respect of the East London Company by reason of the shortness of the water-supply in the drought of 1895.

It may, perhaps, surprise those of your readers who pin their faith to municipal control of supply when I mention that in the city of Manchester, in the autumn of the "Jubilee" year, the supply was so short that baths had to be prohibited; that in Bradford the corporation, as appears from a report of the waterworks committee in October 1887, "have been under the necessity of placing the town on short supply during portions of the years 1876, 1877, 1878, 1879, 1880, 1883, 1884 and again this year," and that during the weeks of frost in 1895, to which I have alluded, the inhabitants of Sheffield suffered quite as badly as any of the inhabitants of London, and found out that frost was no respecter of persons.

As regards the stoppage of supply by frost, in some few cases this did arise from freezing of the smaller mains, but in most cases the stoppage of supply by frost arose from the imperfect laying and care of the service-pipes into the houses—which pipes are the property of the consumers. In my own house I took care of these pipes, and I never had a day's stoppage of supply throughout the whole period.

As regards the East London case. It is difficult to speak of this with calmness, having regard to the way in which this company was treated. In the year 1893 they applied for an Act containing powers to increase their storage capacity, when it pleased the Parliament of that day, at the instance of the London County Council, to throw out the Bill upon the second reading, and not even to send it forward to a committee to ascertain the necessity for this increase. This decision was arrived at by a majority of twenty-four, including as most fit persons to determine on a London Water Bill, fifty-six Irish, twenty-three Scotch and eight Welsh members. Two years afterwards happened that which it had been the very object of the works then applied for to prevent—a short water-supply; that which was called in the newspapers a "water famine." But those who adopt such an expression should read the report of the Local Government Board inspector who held an inquiry in December 1895 into this matter. They will find that during the so-called "water famine" there was an average supply of 30 gallons per head per diem, that there was never pumped into the district a quantity less than 26 gallons per head per diem. As perhaps your general readers may not appreciate this statement as to whether 26 gallons per head per diem is a sufficient supply or not, I may point to the instance of the Manchester new supply from Thirlmere. Manchester is bound on demand to afford water to certain other towns so long as there remains for Manchester 25 gallons per head per diem.

In conclusion, may I repeat that I earnestly advise the rate-payers of London to leave the water supply in the hands of private companies? If on some sentimental ground, such as "that a public need should be satisfied by public means," they will not consent to this being done, then let it be put into the hands of a new body which will utilise the existing undertakings and sources of supply; but, in the interests of the already overburdened, unhappy householders, do not give it to a body who are pledged to discard the present sources of supply and to find new ones—a fearful cost.

#### RESPONSIBILITY FOR DRAINAGE.

Two important cases connected with questions of drainage have been heard in the Queen's Bench Division. The plaintiff in *Holland v. Lazarus* carried on the business of a lodging-house keeper at 18A Dyssell Street, Dalston Lane, and the defendant is the owner of Nos. 20, 22, 24 and 26 Dyssell Street, adjoining the plaintiff's premises. The plaintiff claimed

SKETCH OF INTERIOR

damages for a nuisance created by sewage matter percolating through the soil into his premises and an injunction. The claim for an injunction was subsequently withdrawn and also a counterclaim by the defendant. It appeared that a drain from the defendant's four houses, constructed under the order of the vestry in 1884, ran under the plaintiff's lodging-house. It was alleged that, owing to the defective construction of this drain, the lodging-house was, in the earlier months of 1896, rendered partly uninhabitable by the percolation of sewage and noxious gases, and that this resulted in serious loss of lodgers to the plaintiff. The defence was that the nuisance was caused by the plaintiff or his predecessor in title having a 3-inch rain-pipe improperly connected with the drain by means of a 6-inch pipe. Evidence was given that there was absolutely no fastening in the connections and that the smells and leakage resulted, at any rate in great part, from this fact, though it was alleged that leakages had also occurred from other portions of the defendant's pipe.

Counsel for the plaintiff submitted that the plaintiff, or his predecessor, by connecting his rain-pipe with the defendant's drain had turned it into a sewer, and that it was therefore repairable by the vestry.

Mr. Macaskie, in reply, contended that the pipe in question was a drain within the definition of section 250 of 18 & 19 Vic., c. 120, being a "drain for draining" a group or block of houses by a combined operation under the order of a "vestry or district board."

Mr. Justice Bruce was at first inclined to hold that the pipe was a "drain," but subsequently held that, though it had been a "drain" for defendant's four houses, the junction of the rain-pipe in the plaintiff's house had made it a sewer. He cited *The Queen v. the Vestry of St. Matthew, Bethnal Green*, as an authority for his decision. He also held that the plaintiff could not recover for nuisance, on the ground that whatever nuisance there was arose from the imperfect joining of the plaintiff's own pipe on his own premises. But he held that a certain amount of leakage from the defendant's pipe, as it passed under the plaintiff's house, had been proved, and that, on the authority of *Humphries v. Cousins*, the defendant was technically liable for a trespass. Mr. Robinson submitted that, the leakage being from a sewer which was repairable by the vestry, the defendant could not be liable for the escape of his sewage from that sewer, but his Lordship gave judgment for the plaintiff with one farthing damages for the trespass, but directed that he should pay all costs save such as should appear to the taxing-master

attributable to the trespass, and he gave the plaintiff costs on the counterclaim.

In *Holland v. Pearce* the plaintiff claimed damages for misrepresentation by the defendant in connection with the letting of No. 1 Colham Villas, Yiewsley, West Drayton, to the effect that the drainage was in perfect sanitary condition and that the water-supply was pure. The defendants denied the alleged representation, and said that, if it had been made, it was true to the best of the knowledge and belief of the defendant William Pearce. Further the defendant Thomas Pearce said that the statement of claim disclosed no cause of action against himself.

Mr. McCall, Q.C., for plaintiff, said that the question was whether the representations were in fact made, for, if so, there could be little doubt that they were made falsely or fraudulently, that was, that the defendant made them recklessly, regardless as to whether they were true or false. In June 1893 the plaintiff applied to the defendant William Pearce, with the view of taking a lease of the house in question. During the negotiations the plaintiff put to him the specific query, "Is the house well-drained, and is the water-supply good and pure?" To this the defendant replied in the affirmative, and as the result the plaintiff took the house on June 28, 1893. He went into possession in July, and from that time his family were subject to periodic illnesses. The well was so arranged that the water was highly charged with sewage. The plaintiff called in the sanitary inspector, and it was found that the pipe leading from the sink was entirely untrapped. There was an old pipe leading from the cesspool, and this pipe, having been broken off, acted as a funnel to discharge sewer gas under the floor of the house. There was also an old brick drain that acted in a similar way. It had never been cleaned, and was more than half full of sewage matter. Plaintiff had therefore no alternative but to leave the house, and he was entitled to liberal compensation.

The plaintiff said he negotiated for taking No. 1 Colham Villas in June 1893. He saw the defendant, William Pearce, who said that the drains were all in good order, and the water was pure. Relying on this statement, plaintiff took the house. Witness then gave further evidence as to the illnesses of his family and the expenses to which he had been put.

Mrs. Holland, the plaintiff's wife, corroborated her husband's evidence.

Dr. Ferris gave medical testimony as to the plaintiff's illness, which, he said, was first gastritis and afterwards of a typhoid character.

READING CASES.—A NEW well-made Reading Case for "THE ARCHITECT" can be supplied on application to the Publisher, the charge for which is 2s. 6d.—Address, P. A. GILBERT WOOD, 175 Strand, London, W.C.

Other evidence was then called as to the state of the drains and the water supply. This closed the plaintiff's case.

Mr. Kemp, Q.C., addressed the jury for the defence. He said that the plaintiff's case had not been justified by the evidence. The charge was in reality a criminal one, but he would satisfy them that when the plaintiff took the house there were no representations as to the drains or water-supply at all, although, so far as defendant knew, the water-supply was good and the drains in order. The plaintiff had looked through the premises himself, and never asked any question as to the drains or water. Moreover, during the occupancy of the previous tenant there had been no complaint. Nor was there any reference to a misrepresentation in the correspondence. It was not till after the issue of the writ that this suggestion was made.

Mr. William Pearce, one of the defendants, was called, and said that he made no mention to the plaintiff of either drains or water.

Dr. Hayden, the previous tenant, gave evidence as to the purity of the water.

Some further witnesses having been called for the defendants, the learned counsel and the judge addressed the jury, who, without leaving the box, found a verdict for the defendants.

### CONTRACTORS' ACCOUNTS.

(Concluded from last week.)

THE first actual work will be to excavate for cellar. The contractor must first lay out the size of excavation and start his labouring men to work either under his own supervision or that of a competent foreman. In either case the exact time of each man should be kept in a time-book prepared for the purpose, and each man on the work should also be provided with time slips similar to the one given below, in which a daily record will be kept of the doings of each workman, including date, time, for whom the work was done and the description of work; these slips do not cost much, and I dare say they may be had at the office of the *Canadian Architect and Builder*. Their advantage and usefulness cover much more than their cost, and are a sure preventative to subsequent disputes regarding time and wages. They should be handed in to the contractor or his clerk at least once a week:—

STUB.		WORKMAN'S TIME SLIP.		
No. 10.	No. 10.	.....189 .		
.....189 .	Work done this day by .....			
(Workman's Name.) for		For Whom.	Description of Work.	Time.
Contractor, &c., on John Doe's cellar, excavating and moving stones, 8½ hours		John Doe	Excavating cellar and moving stones	8½ hours
(..... 2¼" .....	(...1½"....)	(..... 2½" .....	(...1" ...)	

The stub may be kept by the workman, while the slip should be kept on file after the time has been properly charged on the one hand and credited on the other.

By adopting a system of this kind, or one similar, the contractor may know every day, if desired, just how the work is getting along financially. In adopting this method of getting at the actual cost of any work it does not follow that another piece of work of a similar kind will cost exactly the same amount. The knowledge gained to-day by actual experience is not sufficient for an estimate to be made six months or a year hence; and accordingly the contractor must be constantly laying about him for new ideas, ever on the alert to take advantage of new methods and ready to make application of these novel plans that are constantly being put forth to facilitate work and reduce cost. It is impossible for the non-progressive contractor, who still adheres to the methods of twenty-five years ago, to compete with men whose organ of order is largely developed, and who are alive to every modern innovation if it gives promise of advancing his interest.

Besides adopting the foregoing method of time-keeping, the contractor should have a slip for his own use, which might be termed "A Memorandum of Estimate and Costs." This memorandum should be for the purpose of noting results and comparing them with first estimate in order to discover lapses or discrepancies. In my own practice, when contracting I found this system of great utility in giving a definite to every transaction connected with the work in hand, which served me well when making estimates on other buildings. I give herewith a form that is generally employed for this purpose:—

Here the contractor may tell at a glance what any piece of work cost him, and he may be able to judge from this what any similar work is likely to cost him, though, as before stated, it will not do to accept blindly as the probable expense of one piece of work because a similar piece previously cost a certain sum. No matter how much alike two pieces of work may be in style, material and surroundings, there will always exist conditions that will make differences of cost. This is a well-known fact among experienced contractors.

The great leak that is so often found in contractors' affairs is generally to be looked for in the labour department. When I say "labour department" I do not confine myself to the labouring man, the man who works with pick and shovel—as a rule he performs his part well and honestly, and his pay is small—I mean the loss is mostly found in the pay-sheet of the high-priced mechanic, chiefly because he has not been handled properly. After the quality of order in a contractor should follow a knowledge of men and an ability to lead them to successful endings. There should be no delay in paying their wages. If any portion of wages due the mechanic is held back from any cause, that mechanic at once becomes a creditor of the contractor, and cannot, from the very nature of things, feel bound to do more for his employer than his own ideas and inclinations will permit. Prompt payment of wages does much towards making prompt and industrious workmen. Be prompt and correct in all your dealings with men in your employ, then you may expect to receive prompt and effective service, for you hold the right to exact it.

In letting sub-contracts, it is usual to pay the sub-contractor in the same ratio as the contractor is paid. This in all cases should be understood, in order to prevent disputes. It is always better for a contractor to sublet the work of heating and plumbing, but in doing so it should be understood that all the work must be done in accordance with the demands of the main specifications and drawings, but if there are no drawings showing the system of piping for the heating and plumbing, with radiators, registers, baths, sinks, taps, vents, &c., a plan should be prepared before the work is let, and this plan should be approved of by the architect or by the owner if there is no architect employed. I must warn the young contractor here concerning the matter of heating and plumbing, and advise that if he has had no experience or a very little experience in these branches, he should take no definite action about them until he has got the opinions of some person or persons who have had a lengthy experience. Indeed, in preparing an

# THE NEW EXPANDED METAL

Meshes from  $\frac{1}{8}$ th in. to 6 in. wide. Strands from 24 B.W.G to  $\frac{3}{16}$ th in. thickness of steel.

**FOR BUILDING CONSTRUCTION**, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

**FOR SOLID PLASTER PARTITIONS**, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

**FOR FIREPROOF LATHING**, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

**FOR CONCRETE FLOORS WITH EXPANDED METAL**.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

**FOR EXTERIOR WALLS OF BUILDINGS**.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

**FOR FENCING, TREE GUARDS, WINDOW GUARDS**, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

**ORNAMENTAL. STRONG. CHEAP.**

**OTHER USES FOR EXPANDED METAL**.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away. Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

**BRASS, ALUMINIUM**, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

**CATALOGUES AND PRICE LISTS** can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

## THE EXPANDED METAL COMPANY, LTD.,

39 UPPER THAMES STREET, LONDON, E.C.

Telegraphic Address, "Distend, London."

Works—WEST HARTLEPOOL.

Telephone No. 1829.

estimate, when much plumbing is to be done and where a system of heating is to be placed in the building, it is always the wisest plan to submit the drawings and specifications to some experienced person in the business, and have him estimate on the work and say what he will do it for. The figures secured, it is well to add from 5 to 10 per cent. to them to cover the contingent expenses that are sure to arise. If the mason-work, painting and portions of the work are sublet for fixed amounts, do not forget to add a percentage to the amounts to be paid to sub-contractors, for it must be borne in mind that you cannot be responsible for another man's work and see that he performs his proper duties without an expenditure of time, labour and money.

Having received and accepted the most suitable bids for the various works and added them to the figures estimated for the work you intend undertaking yourself, the next thing will be to add an additional 5 or 10 per cent. to the whole amount, which sum should represent profit above all and every expense in connection with the contract. If this amount or a greater one does not result from the work when completed, it cannot be said that it was a profitable contract as business matters go.

I would like to say right here that no sensible contractor ever "jumps" at the cost of a building and takes the work at the figures he gives, neither will he adopt the method of "cubing" in making an estimate that he intends to use when tendering for a piece of work. Cubing may do well enough in experienced hands for making an "approximate" estimate of the cost of a building, but proves a snare and a pitfall if relied upon as being exact.

Besides the blank forms presented in the foregoing, there are many others that are used by contractors in their practice, varying according to the character of work and its locality.

### PROPOSED MUNICIPAL BUILDINGS AT LANCASTER.

A MEETING of the Lancaster Town Council was held in committee on Friday evening, at which it was proposed to purchase the property in Dalton Square belonging to the Misses Coulston, containing 5,500 square yards, for public purposes as a memorial of the Queen's diamond jubilee. The property in question has long been looked upon as a suitable site for public buildings, fronting on to Dalton Square, a splendid open space in the

centre of which is the well-known "oval." The erection of a large public hall on the site was also considered as part of a further scheme of municipal buildings. The need for a new town hall, police court and municipal offices has long been felt and urged upon the Corporation. The matter was eventually adjourned after a long discussion.

### PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

#### APPLICATIONS FOR PATENTS.

2607. George Percival Milnes, for "Improvements in or relating to starting-gear for vehicles."

2668. Freund & Fink, for "Improved device for disinfecting the seats of closets and the like."

2689. George William Ward, for "Chimney and ventilating-shaft, top down-draught preventer and windguard."

2703. Thomas Drummond, for "Improvements in and relating to chimneys, cowls and ventilators."

2733. William Henry Witham, for "Improvements in apparatus for flushing water-closets, urinals and other like purposes."

2737. John Hamilton Morgan, for "An electric alarm sash-fastener."

2869. William Holt, for "Improvements in and connected with screens for the use of builders, contractors and others."

2878. Amos Hall, for "Improvements in the construction and arrangement of hospitals, applicable also to other buildings."

2942. Martin William Maylard, for "Improvements in water-closets."

2959. Mitchell Holt, for "Improved weightless window-sash and frame."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 73 Chancery Lane, London, W.C.

# THE Architect and Contract Reporter.

## EDITORIAL NOTICES.

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

## NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

*For Advertisement Scale, see page xiii.*

WINCHESTER CATHEDRAL—THE CHOIR.

WINCHESTER CATHEDRAL—WEST FRONT.

PROPOSED HOUSE AT HINDHEAD FOR DR. A. CONAN DOYLE.

THE DOVER CASTLE, WESTMINSTER BRIDGE ROAD, S.E.

**BUILDING AND BUILDERS.**

THE ceremony of cutting the first sod in connection with a new church at Weston, near Runcorn, took place on the 20th inst. The building is estimated to cost about 4,000*l*.

A MEMORIAL stone of a new mission church at Abercych, in the parish of Manordeify, North Pembrokeshire, was recently laid by Mrs. Saunders Davies, of Pentre. The church will seat 160 worshippers, and the whole expense of its structure will be borne by two ladies.

PLANS have been passed for the conversion to the purposes of a tavern of the house in Mawson's Row—a turning out of Chiswick Mall—in which it is traditionally said Pope lived with his parents from the time they left Binfield until 1717, when his father died and was buried in Chiswick churchyard.

THE foundation-stone of the Prescot new infirmary which the guardians are erecting at a cost of 25,000*l*., including a new laundry building, was laid on the 18th inst. There will be four blocks of buildings, all of local brick, with stone dressings and quoins, and they will be in line with the present erections. Two of the blocks will be three storeys high, one two storeys, and one special block built as a maternity ward. The whole will afford accommodation for 300 beds. The architects are Messrs. J. & W. Gandy, St. Helens; Mr. Fred Brown, St. Helens, the builder, while Mr. W. Molyneux, St. Helens, is erecting the laundry.

ON Tuesday H.R.H. Princess Henry of Battenberg visited Messrs. George Wright & Co.'s, 155 Queen Victoria Street, and selected some mantel-pieces and grates for Osborne Cottage.

## TRADE NOTES.

THE new Board schools, Shrewsbury, are being warmed and ventilated by Shorland's patent Manchester grates and patent exhaust roof ventilators, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

MESSRS. FREDK. BRABY & CO., Limited, have opened a branch of their business at Ashton Gate Works, Coronation Road, Bristol.

WE have received some specimens of the admirable reproductions of the "Autocopyist," for which it is claimed that it produces up to several hundred superior black copies of anything written or drawn with any ordinary pen on ordinary glazed paper. By sprinkling "transfer powder" over any of the copies they act as fresh originals even after months, thus an unlimited number of copies can be obtained from one writing or drawing. Tracing paper or tracing cloth can be used with very good results. All parts of the Autocopyist keep for years, and are always ready for use. The specimens referred to comprise letters, sketches, and architectural drawings, the original writing or drawing of which was done with an ordinary pen on ordinary paper, therefore the copies are a facsimile.

## VARIETIES.

NEW schools have been erected in connection with the Nutgrove Wesleyan chapel, St. Helens, at a cost of 2,400/.

CARR'S LANE Congregational church, Birmingham, is to have a large sum spent on it for renovations, and the school premises in connection with it are to be enlarged.

WORKMEN are busily engaged in removing the stucco which has so long disfigured the exterior of Gray's Inn Hall, which is to be cleaned and restored to its original condition.

THE new parish church of St. George, Heaviley, Stockport, was consecrated yesterday. The church has been erected at a cost of some 40,000/ by the Christy family.

MR. JAMES STABLES, J.P., has offered to present 5,000/ to the Leeds General Infirmary for the purpose of erecting a new supplementary home for nurses on land recently acquired for that purpose. It is intended to erect a building for the accommodation of fifty nurses.

NEW YORK city has fewer churches in proportion to its population than any other large city in the United States. New York has one church for every 2,837 people, Chicago one for

every 2,199, Brooklyn one for every 2,105, Philadelphia one for every 1,576.

WHEN the Bill proposing to give sanction to the Midland Railway Company to construct a viaduct over St. Pancras Churchyard is brought forward, Mr. H. C. Richards will move an instruction to the committee calling upon the company to refrain from interfering with human remains buried in the churchyard.

A COPY of Holman Hunt's great picture "The Light of the World," reproduced under the supervision of the artist himself, will be given with the *Quiver* for March. Mr. Hunt has signified his satisfaction at the manner in which the picture has been reproduced.

AT a committee meeting held on February 22 the subscribers to the Stockport Infirmary decided to suitably commemorate the Queen's record reign by enlarging and improving the present building. Messrs. Woodhouse & Willoughby, of Manchester, were selected as the architects to carry out the same.

THE roof and side wall of a small house in Boston Place, Marylebone, fell in recently. The house was occupied by a man named Fletcher and his family, another family named Atwood and others, and some of the inmates were more or less injured by the fall. The accident is attributed to railway operations being carried on in the vicinity.

A PUBLIC competition of designs for the Sutherland Institute, Longton, has just been decided by Mr. W. Gilbee Scott, as assessor, in favour of Messrs. Wood & Hutchings, of Tunstall and Burslem, whose design "Knowledge" was placed first, and their design "Compact" was placed second, thus carrying off the two premiums of 75/ and 25/. The building will provide a public library, and technical schools of science and art, manual training and cookery. On the 7th of last month the foundation-stone was laid by the Prince of Wales, although the plans at that time had not been adopted. The estimated cost is 8,000/.

THE British Indian Association have written to the Bengal Government taking exception to the exclusion of Government buildings, other than those used for military or naval purposes, from municipal jurisdiction, as proposed in the Bill which has been introduced into the Bengal Council. They admit that the measure is reasonable enough as regards State buildings erected and maintained under the supervision of the Public Works Department, though they think that here also there is a sanitary side to the question for which the municipalities can alone be responsible, but what they chiefly object to is the wording of

the Act, which they complain is such that it may be held to include thanas, registration offices and pounds, schoolhouses, which also serve the purposes of the local post office, and the Government agency for the sale of quinine in pice packets, and other buildings for which no valid cause for exemption is apparent. If, remarks a contemporary, the municipal agency were only an efficient one, nothing would be more reasonable.

WE have lately had submitted to us a sample of Lyte's Woven Metallic Stair-Tread, which we understand is being tried with excellent results at the Army and Navy Stores, Harrod's Stores, Sloane Square Station, and other places. It is composed of lead wires about  $\frac{1}{8}$ -inch diameter, each having a steel-wire core. These are laid parallel to one another, and woven in the opposite direction with plain steel wires about 18 B.W.G. The material is then rolled so as to flatten the lead wires and give an even surface. It can be made in sheets of any size, and can be easily bent at the edge to form the nosing of the stair. The tread certainly seems to be capable of supporting the claims made on its behalf for durability, easy fixing and security against slipping, the lead giving an excellent foothold and the portions of steel wire exposed preventing undue wear. It is also made with brass wire for ship use, and is well adapted for omnibus and tramcar steps. It is being brought out under the auspices of Messrs. Easton, Anderson & Goolden, Limited, of 3 Whitehall Place, S.W.

THE work in connection with the conversion of the Leinster Hall, Dublin, reference to which was made in these columns recently, is now being energetically proceeded with. During the past few days the side balconies have been entirely cleared away, and the front balcony over the entrance from Hawkins Street will be wholly removed in the course of a few days. Portions of the stage still remain, but these are being rapidly removed. The wooden flooring of the hall has been lifted, leaving the bare earth exposed. The present works are being carried out under the direct supervision of the local representative of the syndicate, Mr. J. Edward Whitty. As soon as the preliminary operations of dismantling the interior of the hall have been accomplished, it is understood that tenders for the construction of the new Theatre Royal will be invited, and it is believed that the reconstructed building will be available for the public during the coming Horse Show carnival. The stage will be one of enormous dimensions, stretching from the back as far forward as the door by which parties using the fauteuils in the Leinster Hall obtained entrance to their seats. The theatre will be perfectly isolated on all sides, and danger from fire will

be reduced to the very smallest minimum. Mr. Matcham is the architect, and the new theatre will be erected under his supervision.

### NEW CATALOGUES.

MR. H. MÜNZING, of 199 Upper Thames Street, E.C., has sent us a batch of catalogues and price-lists of his various specialties. Conspicuous among these is the Howard Thermostat, an automatic heat regulator which controls the fire in a furnace or boiler by means of the thermostatic plate, which is fixed in a living or other room. This plate is an equilateral triangle of 8 inches, is a very neat and highly polished plaque, and is placed on the wall of any living room about 6 feet from the floor. On the front of this plaque and near the bottom is a small index, which is used to set the Thermostat to the desired temperature. The index connects with the bell crank on the rear of the plate. Attached to the bell crank is a braided silk cord, which extends down through the partition to a point just below the floor, and over frictionless pulleys to the cylinder dampers. These dampers are made of sheet brass, and measure  $8\frac{1}{2}$  inches long and  $10\frac{1}{2}$  inches in diameter, and have a partition extending through the centre dividing the draught from the check. On each end of the cylinder is an opening 6 inches in diameter; one end is connected by a pipe with the ash-pit section of the furnace or boiler and the other end with the smoke-pipe. The cylinders are slotted, one being fixed, while the other is pivoted so it may be easily rotated. These slotted openings are so arranged that when in certain positions those on one side of the partition will be open, while those on the other side will be closed. The material used in the construction of the Howard Thermostat is of high grade and is guaranteed in every particular. The thermostatic plate furnishes the power by contraction and expansion, and is so sensitive that the finest working machinery is required in its manufacture. It is composed of the most sensitive known material, and works quicker than a mercurial thermometer. The cylinder dampers are made of brass, protected by a covering or jacket of iron, and are so constructed that they cannot get out of order.

MESSRS. JOHN SHAW & CO., Maryhill Ironworks, Glasgow, are sending out a new illustrated price list of flange pipes, hydraulic cylinders, beds and rollers for laundry engineers, beetling beams for dyers and bleachers, columns, jobbing castings, &c., &c.

## FACTORY—346, 348, 350 EUSTON RD., LONDON, N.W.

**NORTH BRIDGE STREET IMPROVEMENT.**

At a recent meeting of the Lord Provost's committee of Edinburgh Town Council, the report of a sub-committee on the North Bridge Street reconstruction was considered. The sub-committee recommended that the elevation plans for the reconstruction of the buildings on both sides of the street submitted by Messrs. Scott & Williamson, architects, whose designs were adjudged first in the competition, should be adopted with such modifications as the Council might think necessary. Failing satisfactory offers from outside parties to undertake the work, in whole or in part, at their own risk, the sub-committee were of opinion that the reconstruction should be executed by the Corporation itself. The Lord Provost's committee approved of this report, and agreed to ask a remit to instruct the preparation of working plans for the corner blocks meantime, and to obtain estimates.

**ASPINALL'S ENAMEL, LIMITED.**

The general meeting of the shareholders of Aspinall's Enamel, Limited, was held on February 23, when the report and accounts for the year 1896 were duly approved. The directors recommended a dividend making 5 per cent. for the year, and a substantial sum was added to reserve.

The Chairman in his address remarked that the sale of Aspinall's Enamel in tins and tinlets was as large as ever, and that the company was making a special feature of an enamel for decorative purposes which had been used with great success at some of the large hotels in the West End. He also remarked that their other manufactures were meeting with due appreciation from the public, particularly "Wapicti," the sanitary washable distemper. This is an article which is extensively used by large institutions, the War Office and others, and is highly suitable for the walls of public buildings, hospitals and private houses.

After the usual vote of thanks the meeting terminated.

**A SECURE AUTOMATIC AND ADJUSTABLE SASH-FASTENER.**

The accompanying illustration shows Arthur W. Adam's new patent sash-fastener, called the "Protective," which admits of either or both of the sashes of a sliding window to be securely adjusted independently of each other at any position desired. It will be seen that two studs, C and D, which are self-acting,

enter the spaces of plates F and G directly they come opposite. Both studs are simultaneously released by means of the knob K, and the sashes again become fastened when pushed to the next position desired. The sashes may be regulated to any degree for ventilation by the upper or lower sash or both sashes, as well as closed. Each sash being securely held, no other fastener is necessary.

The automatic principle of this fastener insures perfect security, and saves trouble; at the same time is suitable for, and can be fixed to, any sliding window without cutting away; is neat in appearance, simple and reliable.

A special form of this "Protective" sash-fastener, with a loose key instead of the knob, is supplied for asylum windows which require to be regulated only by authorised persons.

For lofty sashes another pattern is made to work with cords which regulate the lower as well as the upper sash.

## PUBLIC WORKS AND BUILDINGS.

ACCORDING to the statement of the Secretary to the Treasury, in 1896-97 the increase on the net total of this class over the net original estimates for 1895-96 amounted to 130,704*l.* For 1897-98 there is a decrease of 35,972*l.* as compared with the exceptional estimates for 1896-97, though the total is still 83,370*l.* higher than the total of the original estimates of this class for 1895-96. The most noticeable features of the present estimates are as follows:—In order to expedite the construction of Block 2 of the new Admiralty Buildings, a sum of 40,000*l.* is asked, as against 25,000*l.* in 1896-97. The increase of 26,000*l.* for public buildings, Great Britain, is due mainly to the Patent Office extension, the new Record Office and the extension of the General Register House, Edinburgh. Under the Survey's Estimate, which shows a net increase of 7,151*l.*, increased provision is sought for the revision of the 1-inch map of Great Britain; a new subhead has been raised for employing outside contractors to assist in engraving maps, and under a new arrangement the proceeds of the sale of Ordnance maps are brought to account under this vote, instead of the vote for stationery and printing. In 1896-97 a special item of 30,000*l.* was included under the Harbours Vote for improvements at Holyhead in connection with the mail service. For 1897-98 the total of the estimate has reverted to a more normal figure, with a reduction of 29,288*l.* The estimate for rates on Government property, which showed a net increase for 1896-97 of 55,620*l.*, shows a further increase of 24,514*l.* for 1897-98, raising the net total to about 400,000*l.* For 1897-98 the gross total for rates stands at 416,987*l.*, or nearly twice the corresponding total (226,105*l.*) for 1887-88.

## GERMAN MAXIMS ON SCHOOL SANITATION.

THE following maxims on school sanitation are the result of several conferences held by a number of prominent German physicians, architects and sanitary engineers and school teachers. They are translated by Mr. Gerhard in *Architecture and Building*:—

## 1. Light.

*Site for a School House.*—The school-house building should

as much as possible be so placed with regard to the points of the compass that the windows of the classrooms will face the north-east or else the west. The latter aspect should only be considered admissible for schools in which in the summer no teaching is done in the afternoon.

With regard to ventilation and exposure to sunlight it is to be desired that the classrooms be all located on one side of a corridor only.

*Windows.*—The windows should be wide and should reach as near to the ceiling as possible. The wider the classrooms are the higher should the windows be.

The light should always come from the left side, never from the right, nor from two sides, nor from the front.

Arched windows should be avoided, as they reduce the area of the upper part of the window, which is the most important one as regards lighting.

Window piers should be kept as narrow as possible.

The plan of the studies should be so arranged that the entire lessons are given during daylight. Particular care should be taken to have those lessons which require much use of the eyes given during the lightest hours of the day (drawing and writing lessons).

*Dimensions of Schoolroom.*—The following should be taken as the maximum dimensions of a schoolroom:—

For length, 9 metres (29½ feet).

For width, 6 metres (19½ feet).

For height, 5 metres (16½ feet).

The so-called long rooms (in which the proportion of length to width is as 3 to 2), and in which the desks stand parallel to the short side of the room, are the most desirable from a sanitary point of view. Square rooms are only admissible in the case of a small number of scholars. Classrooms of great depth, in which the desks stand parallel to the long sides of the room, are to be avoided because of the direction in which the light falls from the windows.

The least best seat in the classroom should have ample light and, if possible, on dark days, an illumination equivalent to at least ten standard candle lights at one metre distance.

*Curtains, Blinds and Shades.*—Direct sunlight or strong reflected light must be avoided by the use of curtains, blinds or shades. The latter, however, should not darken the room too much. Shades of a light buff or cream colour are the best. If shade rollers are used, the shade roller should not be placed in the window recess, as otherwise the upper part of the window will be darkened.

ARCHITECTS' CERTIFICATE FORMS,  
ARRANGED BY AN ARCHITECT.

Improved Form, complete with Index, numbered in duplicate, detachable receipt. Books of 100 forms, leather back, linen cloth sides, price 5*s.*, post free, 5*s.* 6*d.*; or four for 20*s.*

By the same Author.

## ARCHITECTS' ORDER FORMS,

For Extras and Additions, bound as above. 100 forms 8*s.* 6*d.*, post free, 8*s.* 9*d.*; or four for 14*s.*

"As Certificates and Orders are always liable to be produced in law courts, it is well to have them prepared in a way that will satisfy judges and jurors as well as clients. It can be claimed that the new forms will sustain that sort of test successfully."—*The Architect*, April 26, 1895.

SAVORY & COLES,  
Steam Press, Cirencester.

REAP'S PATENT  
DETACHABLE HANDLE TROLLEY.

For Banks, Warehouses and Newspaper Offices. Is used at the London and County Bank, at Head Offices and Branches; at the Alliance Bank, London and Lancashire Office, and at Messrs. George Newnes & Co.'s Newspaper Offices. These Trolleys are supplied with Rubber Corners to avoid collision with doors, fittings, &c., and can be placed in lift with handle removed. Particulars and Estimates on application to Sole-Manufacturers, J. REAP & CO., Engineers, Ironfounders, and pattern Makers, 16 Colindale Street, Southwark, S.E.

**Walls and Ceilings.**—Walls and ceilings of a schoolroom should be finished in a light colour.

**Artificial Light.**—Artificial light should be used only where it is impossible to so arrange the plan of the school studies that all lessons will be given in daytime.

The electric light, and in particular the indirect reflected light, is the one best adapted to schoolrooms, because it is powerful and strong, does not heat the air of the room and does not give off injurious products of combustion.

Artificial lighting should fulfil the following requirements:—

(a) Each seat should have ample light and the writing or the book of the pupil should not be shaded.

(b) The light should not flicker.

(c) The light should not be blinding to the eyes and it should not give off too much heat.

In case electric light is not available, particular attention should be paid to the ventilation of the schoolroom during the hours when artificial light, either gas light, oil lamps or candles are used.

## 2. Air.

**Ventilation.**—The proper and ample ventilation of the schoolroom is an absolutely essential requirement. Each room should be flushed with pure air just before the school commences and also during each recess.

Natural ventilation should be effected by having all scholars leave the class after each lesson and opening all windows and doors (air-flushing). This should be done not only in summer, but in the winter as well.

In the schoolyard or the playground there should be provided a pavilion, protected by being covered over with a roof, but kept open at the sides, for use of the pupils in case of stormy weather.

The length of each recess should be about fifteen minutes. A recess should be taken after each lesson. In case of very cold weather the length of the recess may be shortened.

For the lunch in school at least twenty minutes should be allowed.

Artificial ventilation should always be combined with the heating. This is particularly desirable where there is no special system of ventilation. Even the most primitive heating apparatus—such as, for instance, the German tile stove—can be combined without much difficulty or expense with a simple means of ventilation. Where the school building is to be provided with an elaborate system of ventilation, change of air by means of fans or blowers (mechanical ventilation) should be

considered as being the best system. All fans and blowers should operate noiselessly.

Allowance should be made for at least 5 cubic metres or about 175 cubic feet of air-space for each scholar. The number of pupils in one class should not exceed fifty. According to Morin and Professor Rietschel 15 cubic metres or 525 cubic feet of fresh air should be admitted per hour per scholar.

The relative humidity of the air in the schoolroom should not exceed 70 per cent., and be not less than 50 per cent. In case no provision is made in connection with the central heating apparatus for adding a certain percentage of moisture to the air, vessels containing water should be set up in the classrooms, so that the air may not become too dry.

**Removal of Dust and Impurities.**—Overcoats, rubber coats and rubber shoes should be hung up outside of the schoolroom. Provision should be made for the cleaning of the shoes by shoe-scrappers, &c.

In the selection and construction of the floor of the schoolrooms due regard should be paid to the fact that the better the floor is the easier it is cleaned by means of moist rags or mops.

The floors of all corridors and of all classrooms should be cleaned by sweeping and scrubbing them daily by means of a moist cloth. The same rule applies to the desks, tables and seats, which should always be dusted and cleaned after the floor is cleaned. A more thorough cleansing should occur at least three times a week. There should be a few cuspidors in the rooms, of the type only which can be filled with water. Spitting on the floor should be strictly prohibited. The dust of schoolrooms may be the means of propagating contagious disease.

The walls of schoolrooms should be constructed with a due regard to protection against cold and dampness.

Once a week when the schoolrooms are thoroughly cleaned it is desirable to clean the walls. In order to facilitate the cleaning of the walls it is desirable that the surface should be perfectly smooth and non-absorbent.

Gymnasiums should be kept clean and free from dust. The floor, if it consists of wood, should be oiled once a year. The entire floor should be cleaned daily with moist rags. All apparatus in the gymnasium, the window sills and the mouldings and cornices, should be dusted once a week.

The air should be changed as often as possible by opening doors and windows and establishing a draught. All jumping mattresses should be covered with a material which keeps out dust as much as possible. Once a week the mattresses should be beaten out in the open air.

# TO PREVENT CISTERNS AND PIPES FREEZING.

## THE UNIVERSAL LAGGING COMPANY, LIMITED,

Supplies an unequalled composition for Coating Cisterns and Pipes, preventing the formation of Ice in Cisterns, and the Bursting of Pipes in Private Houses and Public Buildings; Refrigerators and Refrigerating Sheds. Lining Corrugated Iron and Wooden Buildings, also Boilers (Marine and Stationary). Used by the Admiralty, and the leading Water Works Companies.

HIGHEST AWARDS: EXHIBITIONS 1891-93-94-95.—Awarded the Royal Photographic Society's Medal for Architectural Photography.

**S. B. BOLAS & CO.,**

MEDALLISTS, ROYAL PHOTOGRAPHIC SOCIETY,

Architectural Photographers & Collotype Printers,

11 LUDGATE HILL AND 3 CREED LANE, E.C.

PRICE LIST AND ESTIMATES ON APPLICATION.

**Water-closet Conveniences.**—One water-closet seat should be provided for each thirty children. For girls the number of seats should be doubled. It is desirable to have separate seats for the various classes on account of the varying height required for the seat.

The maintenance of cleanliness and the disinfection of the privies or water-closets and of the urinals should be constantly controlled and watched. Disinfection is not ordinarily required where a good type of water-closet is used and where the excreta are removed by the water-carriage system. During recess there should be an efficient flushing of the urinals, preferably continuously and automatically.

**Heating.**—The temperature of the air in the schoolroom should in the winter time be from 18 to 19 deg. Celsius (64 to 66 deg. Fahr.). At the beginning of the lesson it should be not less than 16 deg. C. or 60 deg. Fahr.

Every schoolroom should have a reliable thermometer, and if possible it should be so arranged that it can be read from the room as well as from the corridor, so the janitor may observe the temperature without entering the class.

In summer time, on days when the temperature outdoors registers 25 deg. C. (76½ Fahr.) at ten o'clock in the morning, the school should be dismissed at 11 A.M. In case some parts of the school-house building are very much exposed to the sun, the inside temperature in the classrooms should be taken as a guide.

### 3. School Lunch.

It is desirable that there should be a special room set apart as a lunch-room, in which the pupils may remain in case of bad or very cold weather and while the classrooms are being ventilated.

### 4. Drinking Water.

During recess ample drinking water of good quality should be provided for the children. It is best to take the supply from the public or city supply. Where this is not available a driven well should be constructed in preference to a dug or shallow well. The water of the well should be examined periodically.

### 5. Position of the Body.

Attention should be given to a good posture of the body. To enable the scholar to sit erect it is absolutely necessary that the desks should be hygienically constructed. A bad posture may ultimately result in curvature of the spine, in insufficient development of the chest, and in disturbances in the circulation

of the blood, in impairment of the digestion, and finally it may become the cause of nearsightedness. The school desk should be constructed in a simple manner, and so that it may be readily cleaned. In every class there should be provided desks of different sizes and heights. The pupils should as far as possible be placed according to their size and height.

### 6. Nearsightedness.

It has been proven by numerous examinations that nearsightedness is of frequent occurrence in schools; also that it increases in frequency and in degree in the higher classes.

Wall maps, drawings and charts should be so hung that they may be visible from every seat in the class. Blackboards of wood should be painted a dark, dull black, but should not have a glossy finish. The paint must be frequently renewed.

Children who cannot see the wall maps or read the writing on the blackboard from their seats should be given seats in the front row of desks.

Reading and writing during twilight or with insufficient light should be avoided.

The distance of the eye from the writing should be at least 25 to 30 centimetres (10 to 12 inches).

### 7. School Baths.

All schools should be provided with baths, preferably in the shape of "rain baths," because these are cheaper in first cost as well as in maintenance, and also because they require less room to fit up and do not use up such a large quantity of water as other forms of baths.

All children should take these baths, except they are exempted by special request of their parents or by advice of their physician.

It is desirable that the baths be so arranged that the feet may not come in direct contact with the floor. A thorough soaping should be applied during the running of the douche. Each child should have a bath once a week.

During the summer months a more frequent bathing is desirable. Each child should have its own separate towel.

In summer the rain bath may be supplemented by frequent outdoor bathing.

### 8. Accidents and Sudden Illness.

Teachers should be familiar with the measures to be taken in case of accidents, injuries or sudden illness.

(Saturdays being a school day in Germany.)

advancement of German industry, we would particularly refer to the educational conditions upon which Germany has relied so largely in the past for the maintenance and development of her industrial progress.

The Commissioners set forth in their Second Report in 1884 the conclusions at which they had arrived with respect to the educational activity of Germany and the Continent, and it is important to record that since that time there has been no disposition to remain satisfied with past achievements. On the contrary, in nearly every case we found evidences of a determination on the part of the municipalities and of the State to increase and extend their schools, and to equip them with the most modern and improved apparatus. In these days of rapid intellectual progress the school becomes antiquated and obsolete almost as quickly as the factory or the workshop, and again and again we found that schools which had awakened our envy in 1882 and 1883 were being entirely rebuilt and replaced by larger and more serviceable edifices. We shall have to mention, even in the few towns we visited, several instances where we found this to be the case, and the manufacturers who assured us of the importance of these institutions during our previous visit were not a whit less convinced now of the urgency of the need of the additions and extensions which had since been made.

The great industrial art schools of Munich and Nuremberg vied with one another at the exhibition in the variety and extent of the works of their students, and we found that for the school at Nuremberg an entirely new building is in course of erection at an estimated cost of 45,000*l*. Separate departments are being provided for the day and the evening students, and special well-lighted class-rooms have been designed for all the different branches of art instruction, as well as for art in its varied applications to wood-carving, metal-work and general decoration. This school, when it is finished, will be one of the finest and most complete of its kind in Germany.

The Gewerbe Museum of Nuremberg has likewise outgrown its former habitation, and a handsome new edifice, conveniently situated, is even now partly occupied by the libraries and collections. In addition to the new buildings already finished, it is proposed to erect a separate range of laboratories and class-rooms for the section devoted to chemical technology, which since our former stay in Nuremberg has increased greatly in importance. These buildings when complete will cost over 50,000*l*. In connection with the Gewerbe Museum there are courses of popular lectures, similar in character to those given

TECHNICAL TRAINING IN GERMANY.

THE report on a visit to Germany, with a view of ascertaining the recent progress of technical education in that country, by Sir Philip Magnus and Messrs. G. R. Redgrave, Swire Smith and W. Woodhall, M.P., contains the following information on some of the new schools:—  
Among the many causes that have contributed to the

at the Conservatoire des Arts et Métiers at Paris, on all new inventions likely to prove useful for trade purposes, and on other developments of science and art processes, which lectures are attended by large numbers of the working classes. In the laboratories a staff of professors and their assistants are employed on chemical research, and students desirous of conducting experiments under the direction of the professors in any special applications of chemical science to trade purposes receive gratuitous instruction. A special feature of this trade museum is the collection of specifications of patents carefully tabulated and open to all inquirers. This collection forms part of the statistical department of the museum, which also contains a history of all the factories of Bavaria, arranged in classes, giving a full account of the processes of manufacture, the number of machines used, the trade-marks and patents owned, the horse-power employed, supplemented by any details which the owner may care to furnish respecting the number of the workpeople and the annual output.

At Stuttgart a somewhat similar museum, only opened in May last, has cost close upon 200,000*l.*, and contains specimens of the art products of different countries, arranged after the manner of the South Kensington Museum. We have given a more detailed account of this museum in connection with our description of the exhibition.

If we turn from art to science we find similar evidence in the various towns visited of the remarkable development of educational institutions and of such aids to industry as education is able to provide. We are led to believe that much more is being done for the training of those destined for the higher ranks of industry in many parts of Germany than in England, and this, too, notwithstanding the large sums entrusted to county councils and borough authorities under the provisions of the Local Taxation (Customs and Excise) Act of 1890. At Stuttgart we found that an entirely new group of buildings had been added to the Technical High School, one side, the Chemical Institute, reserved for the practical study of pure chemistry, and the other for practical training in electro-technology. The Commissioners reported in 1884 that this Polytechnic had recently been enlarged at a cost of 75,000*l.* The erection and equipment of these new buildings has cost about 100,000*l.* Every new appliance that can aid the student in his scientific work is found in the series of laboratories of which this range of buildings consist. It is noteworthy that the instruction given in the

Chemical Institute is exactly of the same kind as that given in the Universities, and although a special feature of the teaching and of the equipment is the prominence given to electrolysis and to electro-chemistry generally, no attempt is made in these new laboratories to teach chemistry in its application to special industries, that part of the instruction being provided for in the main Polytechnic building. The electro-technical laboratories, housed in a separate part of the building, are perhaps only inferior to those still more recently erected in Darmstadt, and are splendidly equipped with every appliance for advanced practical instruction in all branches of physics.

At Darmstadt, a city of 57,000 inhabitants, the Polytechnic or Technical High School has been entirely reconstructed at an expenditure of about 120,000*l.* It consists of a main building for the study of mathematics, drawing, natural sciences and engineering, and of two separate detached buildings similar to but larger than those at Stuttgart for the study of chemistry, pure and applied, and of physics and electro-technology. No thought nor money appears to have been spared in the erection and equipment of these buildings, which are the most complete of those we have yet seen. It must be remembered, in connection with the expenditure on the above-mentioned institutions, that the cost of building in Germany is undoubtedly very much less than in this country.

Since this was written, we learn that a new electro-technical institute has been added to the Royal Technical High School in Hanover, opened by the Minister of Education in October 1895, which ranks side by side with these splendid establishments.

To the instances already quoted may be added the Technical High School of Charlottenburg, at Berlin, which was in process of erection in 1884, and which has since then been completed and extended (at an estimated expenditure of over 450,000*l.*), and the unique laboratories for scientific measurements and research in the immediate neighbourhood of the Berlin School; these when visited by one of our party last year were still unfinished, but they now constitute probably the most complete institute in Europe for physical research.

These instances must be taken as examples only of the steady advance made by Germany in the last few years in the further provision of facilities for the higher scientific training as a means of developing her industries.

In our report already mentioned, we stated that the number of

polytechnic schools was in excess of the requirements of the people, and we attempted to explain the fact by showing that when these schools were originally erected, "Germany consisted of several independent States, which have since been united in the German Empire, and which endeavoured to rival one another in the extent and excellence of their educational institutions." Since then Germany has had time and opportunity to reconsider her position, with the result that whilst none of these institutions have been closed, others have been erected more modern in construction, more completely equipped and better adapted to the now generally recognised need for practical instruction.

To mention one instance only of the efforts made on behalf of trade teaching, we may refer to the Weaving and Dyeing School at Crefeld, which was only completed in 1883 at an estimated cost of 42,500*l.* This has been almost doubled in size by the erection of a new detached building, costing upwards of 15,000*l.*, for the departments of dyeing and finishing, and this school, which we then described as the finest of its kind in Europe, and far surpassing anything of a similar character in this country, has not remained satisfied with the position assigned to it fourteen years ago. The cost of this extension has been defrayed by the State.

In fact, our recent visit has brought it clearly home to us that the Germans have not ceased to believe in the value of the higher scientific education. On the contrary, they appear now to attach greater importance than ever to the connection between such higher scientific training and the development of manufacturing industry. No nation not overburdened with capital would continue to erect and equip institutions for advanced instruction and scientific research without a firm conviction of their industrial value. The demand, too, for such higher teaching seems to increase as the facilities for providing it are enlarged. For whereas in 1884 we stated that the total attendance at the Polytechnicums was little more than 2,000, the attendance of students at Charlottenburg alone, irrespective of the Berlin University, is now 3,000*l.*, while the number of students in the physical and electro-technical laboratories at Darmstadt is already in excess of the accommodation, and the buildings, which were only completed in October 1895, are now undergoing extension.

Indeed, it is worthy of remark that the same object which called into existence some forty or fifty years ago the technical high schools has recently led to their extension and development in a new direction. As far back as that period Germany

began to prepare herself for becoming a manufacturing people. It was her belief in the future applications of chemistry to industrial purposes that led to the erection and equipment at a great cost of chemical laboratories, and to the encouragement held out to students to pursue their studies in those laboratories for a period of five, six or even seven years. The success that has attended the efforts of the Germans to appropriate many important branches of chemical manufacturing industry is well known, and the dependence of those industries on the researches of chemical experts employed in the works is generally recognised. At the Badische Anilin- und Soda Fabrik alone 100 scientifically trained chemists and 30 engineers are now employed.

Her brilliant achievements in the field of chemical industries have encouraged her to establish well-equipped electrical laboratories and to develop the practical teaching of physics with the view of assisting the electrical trades, which are comparatively of recent growth. Twelve years ago the Commissioners had to report that the facilities for practical laboratory instruction in electrical technology scarcely existed, or were of the most meagre kind. At that time nowhere in Germany was to be found so well-equipped a laboratory for electrical engineers as at the Finsbury Technical College. Now there are no laboratories in England which can compare in the detail and completeness of their equipment with those we visited at Darmstadt and Stuttgart; and no facilities exist for original and independent research in physical subjects to be compared with those afforded at the Imperial Physical Institute at Charlottenburg.

Our recent visit to Germany has also impressed us with a sense of the advantages which the nation derives from having an organised system of secondary education. To this matter reference was made in the report of 1884, and we desire to emphasise it. The education of a secondary school is in every way more accessible in Germany than here. The grades and differences of schools are better defined and more clearly understood; the instruction is more disciplinary and exercises a deep influence in the formation of habits and in the training of character; the teaching of modern languages is insisted upon to a far greater extent than in any of our own schools, with results of the greatest possible benefit to the German clerk and commercial agent; the absence of frequent and conflicting external examinations gives more time for careful study; the remission of two years' military service to those who reach a certain standard in a secondary school is a powerful encourage-

To Her Majesty the Queen and Royal Family; H.M. Office of Works; H.M. Office of Woods and Forests; the London County Council, &c. Photographs taken and proofs delivered same day. 50,000 Architectural and Decorative Views. Price List and Catalogues Free.

147 STRAND. LONDON, W.C.

## LONDON AND GENERAL WATER PURIFYING COMPANY'S, LIMITED,

House Cistern fitted with a Cistern Filter.

NO FAMILIES WHO VALUE THEIR HEALTH SHOULD BE WITHOUT ONE OF THE  
PATENT CISTERN FILTERS, Charged Solely with Animal Charcoal. Requiring, when once fixed, NO attention whatever, and superior to any others. Vide Professor Frankland's Reports to the Registrar-General, July 1866, November 1867, and May 1870. The Lancet, January 12, 1867.

Also, Testimonials from Dr. Hassall, September 28, 1868; the late Dr. Letheby, February 15, 1865, and December 1872. Price, £1 10s. and upwards. Portable Filters on this System, £1 5s. to £3.

Patronised and used by Her Majesty the Queen at Osborne, by H.R.H. the Prince of Wales at Sandringham, by H.R.H. the Duke of Edinburgh at Eastwell, by H.R.H. the Duke of Connaught at Baginbun Park, by H.R.H. the Duke of Cambridge, the Duke of the Medical Profession, and at the London, Middlesex, St. George's, St. Mary's, Consumption, Fever, and German Hospitals, and various Lunatic Asylums, Institutions, Breweries, &c., and at all the Schools established by the School Board for London. Pocket Filters, 4s. 6d. and 6s. each. Household and Fancy Filters, from 10s. Water-testing Apparatus for detecting impurities in Water 10s. 6d. and 12s. each.

157 STRAND, W.C. (Four Doors from Somerset House), LONDON.

ment to steady application; and the fees are much lower than in schools of corresponding grade in this country. These are advantages which count for much in enabling the German youth to obtain a good secondary education and in fitting him for the subsequent period of apprenticeship in the counting-house, the merchant's office or the factory. The German boy acquires at school a stock of knowledge which is at once useful to him, and he also acquires habits of accuracy and learns the significance of attention to detail and the importance of discipline and obedience. Our consular reports are full of references to the differences between the methods of training and aptitudes for commerce in Germany and in England, which in many ways are traceable to the fundamental differences in the secondary education of the two countries.

As regards trade schools, we found that these are more common in South Germany, as, for instance, in Austria, than in Prussia, and we were struck with the recognition of their importance, as shown by the fact that in the exhibition at Nuremberg of the products of the different provinces in Bavaria specimens of the work of the pupils of trade schools were in many cases displayed in connection with the exhibits of the factory or workshop, indicating the close relation that appeared to exist between the school exercises and the work of the manufacturer. The instruction in these trade schools is essentially practical, and has been very helpful in the development of several of the smaller industries.

The lesson to be derived from all this activity in matters pertaining to education is clearly this, that our foreign rivals are determined to keep well ahead in the matter of facilities for instruction, and not only so in those institutions wherein the highest branches of scientific instruction are pursued. They are convinced that the nation which has the best schools is the best prepared for the great industrial warfare which lies before us, and no money appears to be grudged for the erection, equipment and maintenance of educational institutions of all grades, and especially of the science laboratories which, as we have seen, are being multiplied in Germany. The great industries of to-day depend more and more upon the successful application of recent discoveries to ordinary manufacturing processes and less and less upon the presence of coal, iron and raw materials. Cheaper and more speedy means of transit are placing all countries more nearly on a level as regards natural resources. Improved tools and labour-saving machinery are rapidly rendering the manual skill and dexterity of the individual workman (upon which we once so greatly relied) of

minor significance, and in the industrial race in which we are engaged nearly all the advantages upon which we prided ourselves in the past are possessed in a greater or less degree by our rivals, and count for little as compared with scientific knowledge and its ready application to the needs of the manufacturer.

### PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

### APPLICATIONS FOR PATENTS.

3309. Cornelious Thomas, for "A new or improved window-fastener."  
 3345. Clara Lucke, for "Improvements in presses for forming artificial stones, slabs, tiles and the like."  
 3361. Robert Joseph Judge and Harry Hunt, for "Improvements in or connected with brazing or soldering-hearths."  
 3454. Thomas Auty and Alfred Watkins, for "Improvements in or relating to machinery or apparatus for engraving and die-sinking from 'former.'"  
 3531. John Wright, for "Improvements in waste or slop water-closets."  
 3571. Albert Hendrik Van Der Vyck, Hendrik Van Der Vyck and Gerhard Van Der Vyck, for "Improvements in the construction of fireproof buildings."  
 3576. John Clayton Newburn, for "Improvements in the manufacture of anti-fouling compositions or paints."  
 3880. Henry Gibbon and William Tyrer, for "Improvements in and connected with windows and window-frames."  
 3883. John Shanks, for "Improvements in and connected with cisterns, sinks, baths and the like."  
 3895. Samuel Y. Davis, for "Improvements in blind-rollers."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CO., Patent Agents, 73 Chancery Lane, London, W.C.

# THE NEW EXPANDED METAL

**Mesher from  $\frac{1}{8}$ th in. to 6 in. wide. Strands from 24 B.W.G. to  $\frac{3}{8}$ th in. thickness of steel.**

**FOR BUILDING CONSTRUCTION**, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

**FOR SOLID PLASTER PARTITIONS**, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

**FOR FIREPROOF LATHING**, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

**FOR CONCRETE FLOORS WITH EXPANDED METAL**.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

**FOR EXTERIOR WALLS OF BUILDINGS**.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

**FOR FENCING, TREE GUARDS, WINDOW GUARDS**, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

**ORNAMENTAL. STRONG. CHEAP.**

**OTHER USES FOR EXPANDED METAL**.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away. Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

**BRASS, ALUMINIUM**, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

CATALOGUES AND PRICE LISTS can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

**THE EXPANDED METAL COMPANY, LTD.,**

**39 UPPER THAMES STREET, LONDON, E.C.**

Telegraphic Address, "Distend, London."

Works—WEST HARTLEPOOL.

Telephone No. 1829.

## NEW CATALOGUE.

MESSRS. D. & J. TULLIS, of Kilbowie Ironworks, near Glasgow, send us a catalogue of their patent rotary-pressure washing and disinfecting machines, which are specially adapted for public institutions, laundries, &c. They are entirely constructed of metal, and consist of an outside shell of mild steel boiler plate, with strong angle steel flush rivetted to ends of same. The ends are cast-iron, strongly ribbed and faced in the lathe, having bored stuffing boxes, fitted with brass liners and brass glands. The periphery is provided with a hinged steam-tight door fitted with brass mountings, hand wheel, steel screw and lever. A strong brass mouthpiece is rivetted to opening in shell with copper rivets, and made true for door to close upon. The catalogue gives prices, floor space required, speeds, weights, horse-power, &c.

## PAVILION THEATRE, WHITECHAPEL.

THE "Drury Lane of the East," as this theatre is not inappropriately named, was packed from floor to ceiling on Wednesday evening, on the occasion of the benefit of the indefatigable *impresario*, Mr. Cohen, who announced, in the course of a gracefully-worded return of thanks, that the takings for the evening had broken all previous records by a considerable amount.

The play given was the successful "Tommy Atkins," to the performance of which the occasion seemed to lead, if possible, additional dash and *verve*. Between the acts Mr. William Terriss gave a recitation, "The Lifeboatman," in his well-known manly and sympathetic manner; Miss Cohen (Mrs. Christian) gave a couple of songs in capital style; and several other good "turns" were provided by local favourites of the music-hall stage; but perhaps the feature of the evening was the well-considered and telling speech delivered by Mr. Ernest Rüntz, the architect of the theatre and chairman of the company which is running it, in the course of which he presented to the highly-esteemed benefi- ciare a handsome silver loving-cup, subscribed for by the employes of the theatre, and a gold fusee case from the members of the company. In the course of his speech Mr. Rüntz announced that the erection of the new theatre at Peckham, which is to be of a very comprehensive nature, including several features not usually found in theatres, is to be proceeded with very shortly, and will probably be ready for opening by Christmas next.

## TRADE NOTES.

THE Convalescent Home, St. Anne's-on-the-Sea, is being warmed and ventilated by means of Shorland's patent exhaust roof ventilators and special inlet tubes, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

MESSRS. STANLEY BROS., LIMITED, Nuneaton, have designed a Diamond Jubilee panel intended for insertion in buildings erected in the course of the present year, for which purpose it will no doubt be extensively employed. Its size is 24 inches by 24 inches. It can be had in buff and red terra-cotta, glazed or plain. It contains a portrait of Her Majesty, surmounted by the date, and surrounded by a suitable inscription and bordered by the names of the numerous colonies.

## VARIETIES.

A FINE pulpit of English oak has been erected in Barnet parish church. In niches on the eight angles beautifully carved statuettes of famous English preachers have been placed, beginning with Augustine, and ending with Wesley and Canon Liddon.

A PAINTER engaged on the Blackpool Tower was shockingly injured on the 1st inst. Whilst working at a height of over 300 feet he got in the track of the travelling balance weights, which work the lift, and one of his legs and an arm were torn off.

THREE hundred pounds for a day's use of a room some 16 feet square and containing two windows, each under 4 feet in width, is not a bad price, and that is the value set on their property by the owners of a room commanding a view of the ceremony at St. Paul's on June 22.

THE annual dinner of the Master Builders' Association was held in Jury's Hotel, Dublin, on the 27th ult., and proved one of the most enjoyable reunions yet held in connection with that institution. The company numbered eighty-seven, and included a very large number of guests.

Mr. J. G. PEAT, architect, of Hamilton, N.B., died suddenly last week. He had been laid up for a week with bronchitis, and was medically attended. The cause of death was rupture of a blood-vessel in the head.

TO-DAY (Friday) Mr. Heinemann will publish "Beauty and Art," by Aldam Heaton. The list of contents includes "The Decoration of the House," "Fabrics," "Furniture and Decora-

ESTABLISHED 26 YEARS.

tion of the Eighteenth Century," &c., and the book represents the author's experience of nearly fifty years' practical decorative work.

THE Liverpool Stock Exchange committee have purchased, for the purpose of extending the Exchange, a strip of property adjoining the present building at a price of 227 $\frac{1}{2}$  per square yard, being at the rate of over 1,000,000 $\frac{1}{2}$  per acre. This is the highest price ever realised for property in Liverpool.

THE next ordinary meeting of the Institution of Civil Engineers will be held on Tuesday, March 9, at 8 P.M. Papers to be further discussed:—1. "The Main Drainage of London." By Messrs. J. E. Worth and W. Santo Crimp, M.M.Inst.C.E. 2. "The Purification of the Thames." By Mr. W. J. Dibdin.

THE thirteenth ordinary meeting of the Society of Arts will be held on Wednesday, March 10, at 8 P.M., when a paper on "The Prevention of Fires due to the Leakage of Electricity" will be read by Mr. Frederick Bathurst. Mr. W. H. Preece, C.B., F.R.S., will preside.

A CURIOUS discovery has resulted from Canon Wilberforce having no use for the cellar beneath his residence in Dean's Yard. Its new owner asked an architect to inspect it with a view to its conversion to other uses, and his investigations resulted in bringing to light a fine Gothic apartment capable of holding thirty people. It will in future be used as a dining-room.

A DANGEROUS landslip has occurred at Whatstandwell Embankment, above the old station on the Midland Railway main line from Manchester to London, and a fissure has developed which threatens danger to the railway line, and to the Midland Company's canal from Cromford to Langley. Traffic on the canal has been stopped, and passenger trains are taken by very carefully. The Whatstandwell Hotel is in the course of the slip, and the landlord has removed his valuables. Other householders are alarmed for their safety.

THE annual dinner of the Commercial Travellers' Benevolent Institution will this year take place at the Hotel Cecil on March 19 under the chairmanship of Mr. Thomas Webber Jerrard, of the firm of Jerrard, Darby & Clegg, of Wood Street. The income accruing to the Institution from funds invested being but slightly more than 1,500 $\frac{1}{2}$ , it is largely dependent on the subscriptions and donations of its supporters. Last year out of thirty-five candidates it was found impossible to relieve more than seven, although all proved on inquiry to be in need of help.

A SUBSTANTIAL Portland stone wall has been erected at the Embankment side of Somerset House, near Waterloo Bridge, and a great improvement in the appearance of that handsome pile has been effected, the work having been carried out in unison with the prevailing style of architecture of the building. The part thus reclaimed was formerly known as the Dock House and was in use a few years ago as a waterway for the entrance of barges from the river into Somerset House. In addition to the erection of the wall, a large room has been constructed which will be used as a repository for papers, &c. The work has been carried out under the direction of Mr. Williams, clerk of the works, Royal Courts of Justice.

AMONG the greatest risks incurred in shooting is certainly that of meeting with an accident either from the carelessness of friends or from pure misadventure. Such a case recently happened to a well-known builder and contractor in Birmingham, Mr. F. Gowing. While he was out shooting one day with two friends a shot hit some hard object and rebounded into his left eye, causing its total loss. Fortunately he had effected a policy with the Accident Insurance Company, of St. Swithin's Lane, London, E.C., and so became entitled to the compensation of 500 $\frac{1}{2}$ .

A PARISH meeting was recently held at Ashford respecting the danger caused by the effluent from the Staines sewage farm flowing into the River Ash. It is stated that an abominable odour emanates from the works where "Bacteria" filters made of flints are employed, and it was decided to forward a copy of a resolution calling attention to the "serious nuisance caused by the Staines Urban Authority in allowing improperly filtered effluent containing sewage matter to flow into the River Ash," to the Thames Conservancy, the Local Government Board and other authorities.

IN some interesting letters concerning the protection of churches from fire, which have recently appeared in the *Guardian*, a most useful suggestion comes from Mr. J. C. Merryweather, who, referring to the dangers of fire in churches from defects in heating and lighting apparatus, proposes that each church tower should be fitted with a tank or tanks, kept full of water by means of a pump and hose or fixed pipe, the pump to take supply from a well or other available source. From the tanks he suggests that a pipe be carried into the church, with hydrants and hose in convenient positions. The water tanks would then enable powerful jets to be brought to bear immediately on an outbreak of fire being discovered. The cost of the arrangement would be small, and doubtless the

destruction of many sacred buildings by fire would be prevented. Canterbury Cathedral has been saved three times by its own fire apparatus, and the recent fire at St. George's, Hanover Square, proves that even in London there is considerable risk of fire in places of worship.

*The House* is the title of a new monthly magazine addressed to "those who manage and beautify the home." It contains some fifty pages, well printed on good paper, profusely illustrated, with articles on "Chippendale Furniture," "Old China," "Art Needlework," "Rooms to be Remembered," "Furnishing Pictures by George Eliot," "Eighteenth-century Silver," "A Marquetry Frame and a Cosy Child's Chair and How to Make them," "Old Mirrors," "The Choice of a Wall-paper," "Odds and Ends in Japanesque," "Cuisine for the Month" and "Floral Decoration for the Table." Its price is 6d., and it ought to "catch on."

THE third annual dinner of the heads of departments and representatives of the firm of Young & Marten took place at the Holborn Restaurant on Saturday, February 20, when the guests were Mr. H. H. Marten, proprietor, Mr. E. Montague Edwards, general manager, Mr. Frank Marten and Mr. Ernest Marten. The heads of the departments present were Messrs. W. Callaghan, B. Carter, A. B. Corke, J. Emery, W. Hall, G. J. Hicks, J. B. Lupton, D. Ovens, E. Parkinson, F. W. Russell, G. R. Scott, C. Sparks, C. A. Spicer, W. Steele, S. A. Stooke, C. Wallis, C. J. Wilford, P. B. Wood; and the representatives were—Messrs. W. Doshier, W. R. Dowsing, G. K. Durrant, G. Hambridge, W. N. Joyce, R. Letby, A. Milne, R. W. Swainson, D. F. Thompson. Mr. Wright was unavoidably absent. The menu was an excellent one; and the dinner will be principally remembered for the surprises by which it was accompanied, viz. the presentation to Mr. H. H. Marten of a handsome piece of silver, and to Mr. E. M. Edwards of a silver salver. The inscription engraved on the former was, "Presented to H. M. Marten, Esq., by the heads of departments and representatives, as a souvenir of the twenty-fifth anniversary of Young & Marten, February 20, 1897"; and on the latter:

"Presented to E. Montague Edwards, Esq., the esteemed general manager of Messrs. Young & Marten, by the heads of departments and representatives, February 20, 1897."

## BUILDING AND BUILDERS.

THE Royal Infirmary, Glasgow, is to be rebuilt as a memorial of the Queen's long reign.

A NEW Wesleyan chapel is to be erected at Cropton, in the Pickering circuit, at a cost of 715*l*. It will be the nineteenth new chapel erected in the district within four years.

AT the meeting of the Winsford Urban Council plans were passed for the new soap works which are being erected at Winsford with all speed by the Salt Union, Limited, on ground facing the River Weaver. The works will cover an area of 720 square yards. The establishment of the new industry is eagerly looked forward to by the inhabitants of the town, especially in view of the continued depression in the salt trade.

MR. JAMES KEY CAIRD, manufacturer, Dundee, has offered to provide the necessary sum to build a hospital for the treatment of diseases of women. The full details of the offer have not been disclosed pending a conference between Mr. Caird and the chairman of directors of the Royal Infirmary; but an indication was given that in the first instance a sum of 5,000*l*. would be placed at the disposal of the directors for the purpose.

AT a recent meeting of the Croydon County Council it was decided to build a new lunatic asylum, to accommodate 400 patients, at a cost of 132,982*l*, or 332*l*. per bed. The plans adopted for this important undertaking were those selected in the open competitive principle, the first premium being 200*l*., and this was awarded to Messrs. Crisp, Oatley & W. S. Skinner, of Scottish Provident Chambers, Clare Street, Bristol. Eighteen firms entered into the competition, the assessors being Mr. C. H. Howell, then consulting architect to the Lunacy Commissioners, and Dr. Moody, the well-known expert on the treatment of lunatics.

THE public health committee of Edinburgh Town Council have instructed Mr. Morham, city superintendent of works, to complete the plans and specifications of the new city hospital, and to obtain estimates for the work. A sub-committee was also appointed to consult with Mr. Morham, with powers to obtain such special advice as they might require in regard to heating, lighting and such matters.

**MASTER PLUMBERS' ASSOCIATION.**

A PARTY of about fifty met at the Colonnade Hotel, Birmingham, on the 3rd inst., on the occasion of the first annual dinner of the Birmingham branch of the National Association of Master Plumbers. The local organisation was formed towards the close of 1895, the object being to advance trade interests. The chair was occupied by the president of the branch (Mr. J. Osborn).

In proposing "The National Association of Master Plumbers," the president said the Association had not been in existence very long, but it could boast a membership of about 800. Its object was to place the plumbing trade on a higher level than had hitherto been attained, and to bring about a better class of work, so that it should not be said that the doctors had to follow the plumbers.

Mr. Peattie responded, observing that the Association now comprised forty-five branches, of which that in Birmingham was the most prosperous of all. Still, their general progression had not been so rapid as it ought to have been considering that there were over 2,270 master plumbers in Great Britain and Ireland, and that those registered represented probably not more than one-tenth of the whole. The speaker went on to complain of the encroachments on the plumbing trade by iron-mongers, blacksmiths and builders, and expressed a hope that the Association would be the means of bringing the trade into the hands of the plumbers. He suggested that they should aim at getting in more intimate touch with the architects, and show them the necessity of receiving separate tenders for plumbing work.

Before resuming his seat Mr. Peattie submitted the toast of "The Birmingham and District Branch." This was replied to by Messrs. Hill and Latham.

**PROPOSED BY-LAWS ON HOUSE DRAINAGE.\***

THE absence of a uniform code of regulations on the subject of house drainage, applicable to the Metropolis, has for a long time caused great confusion and inconvenience to those engaged in the preparation of schemes for such work, as well

\* A paper read by Mr. J. P. Barber, C.E., before the Society of Engineers on March 1.

as to those who have had to execute the work. Arrangements which are permitted in one district are objected to in another; whilst the requirements respecting the work vary considerably according to the views of the members of the local authorities on the subject, some considering that those who build houses should accept the responsibility of providing satisfactory drains and sanitary arrangements thereat, others, that the local authority should themselves prescribe in more or less detail what work is to be done and the manner in which it is to be carried out. The proposal of the London County Council to frame by-laws relating to house drainage has therefore raised some hope that in a little while uniformly satisfactory work will be insisted upon in every district in the Metropolis. The County Council have at length prepared draft by-laws which are at the present time under the consideration of the local authorities by whom they will have to be administered. Having regard to the area which will be affected by the proposed by-laws, it seems desirable that they should be carefully considered by engineers and others who will have to comply with them in all drainage works connected with buildings in the Metropolis on which they may be engaged. This paper has accordingly been prepared with a view to bringing the proposed by-laws to the notice of the members of this Society, and more with a hope of eliciting their opinions respecting them than the expectation of being able to say anything new upon the subject of house drainage.

The proposed by-laws will be made pursuant to section 202 of the Metropolis Management Act, 1855, by which the Council have power to make by-laws "for regulating the dimensions, form and mode of construction, and the keeping, cleansing and repairing of the pipes, drains and other means of communicating with sewers, and the traps and apparatus connected therewith." The same section provides that no penalty shall be imposed by any by-law to be made by the Council unless the same shall be approved by one of Her Majesty's principal Secretaries of State. They are primarily applicable to drains, &c., at new buildings, and the extent to which they affect work at existing buildings will be referred to hereafter.

**By-law 1** provides that no subsoil-drain shall communicate directly with a sewer, but that a suitable and efficient trap shall be provided with a ventilating opening at a point in the line of the subsoil drain as near as practicable to such trap.

This by-law does not prohibit the connection of a subsoil drain direct to a drain which conveys sewage, or which communicates directly with a sewage drain; but in the author's

**Aspinall's**

**ENAMEL**

For Inside and Outside Work.

**READY FOR USE.**

This Enamel, which has taken the Highest Award wherever exhibited, imparts a rich glossy appearance to all surfaces to which it is applied, and dries with a hard impervious surface as washable as porcelain. It is admirably adapted for use in Hospitals, Public Institutions, Mansions, Private Houses, &c., where sanitary conditions are of the first importance. One gallon will cover about seventy square yards on a non-porous surface, and is equal to about three gallons of mixed paint.

**ASPINALL'S ENAMEL** can be made to any tint, is absolutely non-poisonous, and is unequalled for *all* decorative purposes.

Builders and Decorators should apply for full particulars of our special "DECORATOR'S" ENAMEL.

**ASPINALL'S ENAMEL, LTD., NEW CROSS, LONDON, S.E.**

opinion such a connection should not be allowed, as the foul air from the sewage drain will enter the subsoil drain as readily as that from the sewer. In all three cases the trap is necessary, and it should be placed as near as practicable to the point where the subsoil drain joins the sewer or either of the drains referred to, and should be ventilated directly into the open air. The pipes between the trap and the sewer or drain into which a subsoil drain discharges should be of the same description, and should be laid and jointed in the same manner as those used for conveying sewage. This is necessary in order to prevent the escape of foul air from either the sewer or the drain into the trenches in which the subsoil drains are laid.

**By-law 2** requires that a pipe or channel provided for the purpose of conveying to a sewer any water falling on the roof of a building shall discharge over a trapped gully, or into such a gully above the level of the water in the trap.

An addition to this part of the by-law is needed in order to make it compulsory that water falling upon the roof of a building and upon paths, areas and paved surfaces within the curtilage of the premises shall be discharged into properly trapped gullies and conveyed to a sewer, or shall be disposed of in some equally effective manner to the satisfaction of the surveyor to the local authority. It will be seen that, as the by-law is at present framed no provision at all need be made for disposing of water from roofs, paths, areas, &c. Unless a satisfactory method of dealing with such water is insisted upon, the practice of erecting buildings or bay windows without eaves gutters and of allowing the rain-water therefrom to fall upon and saturate the ground adjoining the building and of making what are termed soak-away drains will be continued. It is, moreover, not uncommon for the rain-water from bay windows, porches and porticoes to be conveyed therefrom by means of a downpipe which terminates in the ground close to the building, and there is little doubt that unless this is made illegal by an alteration in the by-law, such a plan of disposing of the water will still be adopted.

The second paragraph of the by-law will make it illegal for any solid or liquid matter from a waste pipe, from a bath, lavatory or sink, or from a soil pipe, or waste pipe from a slop sink, or from a urinal to be conveyed into a pipe or channel conveying rain-water. The arrangement at present allowed by many local authorities by which waste pipes from baths, lavatories and sinks discharge into the open head of a rain-water pipe, will not be permissible under this by-law.

The following are the objections to the arrangement:—

(a) Smells arising from the decomposition of refuse and greasy matter accumulated in the rain-water pipe and head.

(b) Stoppage of the upper part of the rain-water pipe and head during frost, and the consequent overflow of water from the waste pipes.

(c) Inaccessibility of head of rain-water pipe for the purpose of cleansing and removal of obstructions.

The smells referred to in (a) might not be injurious in cases where the pipes are situated some distance from windows or other openings to buildings, whilst the liability to the stoppage mentioned in (b) can be reduced by placing the waste pipes in the head of the rain-water pipe in such a manner as to avoid splashing.

The author thinks that the by-law should be so framed as to leave the local authority at liberty to sanction the fixing of waste pipes from baths or lavatories so as to discharge into the open heads of rain-water pipes in cases where they are of opinion that the arrangement would be satisfactory; but that waste pipes from sinks should be prohibited from discharging in this way, as the greasy matter and small portions of solid material which are frequently discharged through such pipes would be more likely to cause nuisances than the discharge from bath and lavatory wastes.

The Council's proposal will involve a small increase in the cost of plumbing-work at certain buildings where the rain-water pipes might be used to take the discharge from baths and lavatories to the gullies, but it cannot be objected to on sanitary grounds.

Some local authorities require that a rain-water pipe shall discharge into an impervious channel in the open air, leading to a trapped gully 12 or 18 inches distant from the point where such pipe discharges into the channel. The object of this provision is, no doubt, the prevention of foul air from the drains passing up rain-water pipes when the gully traps become unsealed. Although the arrangement referred to is frequently impracticable in town houses, the proposed by-law of the County Council might be altered so as to allow the arrangement to be carried out by those who prefer it, provided the channels are wholly within the curtilage of the premises.

Water falling upon land, roofs, areas or forecourts should not be discharged upon any part of the public way, and it would be for the comfort and safety of the public if the proposed by-law prohibited this being done.

**By-law 3** deals with the materials for and the sizes of drains, jointing, concrete round pipes, means of access to

drains, trapping of inlets, and other details. The by-law provides that pipes used for drains communicating with a sewer, other than sub-soil drains, shall be of glazed stoneware, semi-vitrified ware, cast-iron, or of other equally suitable material.

There appears to be no reason for the words "communicating with a sewer," for the drain referred to in the by-law should be of "good sound pipes," formed of the materials specified, whether it communicates with a sewer, with another drain, or with a cesspool.

The thickness of metal for cast-iron pipes, 3 inches diameter, is to be 5-16th inch, and 3-8th inch for 4-inch, 5-inch and 6-inch pipes.

The thickness of pipes formed of either of the other materials is not specified, but it seems desirable that the by-law should state that for 3-inch pipes the thickness of the material should be not less than  $\frac{1}{2}$  inch, and not less than  $\frac{3}{8}$  inch for 4-inch and 6-inch pipes.

Pipes must be socketed and put together with cement or other equally suitable material.

Cement is a suitable material with which to make the joints of pipes formed of stoneware or semi-vitrified ware, but lead is a more suitable material for the joints of cast-iron pipes. The by-law should therefore make the use of lead compulsory for jointing cast-iron pipes, otherwise disputes will arise when cement is used for jointing such pipes, and it will become a question for a magistrate to decide whether the use of cement in such cases is a breach of this by-law. The by-law should also specify that cast-iron pipes are to be coated with Dr. Angus Smith's composition, or other suitable material, in order that the pipes may be protected from corrosion, and that the inside may be glazed, also that the annular space for the lead with which the joints should be made shall, in 2-inch and 4-inch pipes, be not less than  $\frac{1}{4}$  inch in width, and in 5-inch and 6-inch pipes not less than  $\frac{3}{8}$  inch.

A drain is to be of adequate size and, if for conveying sewage, it must be not less than 4 inches internal diameter, and be laid in a bed of good concrete not less than 6 inches thick.

The width of the bed of concrete is not specified, nor does it seem to be intended that the sides of the pipe should be encased in concrete. An alteration in this part of the by-law is necessary in order to provide that pipes shall be more secure after being laid.

It is intended that underground drains of cast-iron shall be laid in a bed of concrete, but a thickness of 6 inches for such bed is scarcely necessary, 3 inches being sufficient for the

accurate laying and solid bedding of the pipes. Cast-iron pipes are seldom laid on concrete, but having regard to the ease with which the accurate laying of the pipes can be carried out, and the perfect bedding obtained, this method is much better than the ordinary one, in which the pipes are laid on the bottom of the trench.

A suitable fall must be given to a drain, but no minimum fall is mentioned. The drain must be constructed so as to be water-tight, and must be capable of resisting a pressure of at least 2 feet head of water. A drain must not pass under a building except where any other mode of construction may be impracticable.

So much of a drain as passes under a building must be laid in a direct line and be encased in 6 inches of Portland cement concrete. Iron drains are not required to be covered with concrete and they may be carried above ground if properly supported at each joint by piers or other sufficient supports.

Whenever practicable, means of access must be provided at each end of that portion of a drain which is under a building. All inlets, except those provided for ventilation in accordance with by-law 4, are to be efficiently trapped, and the fixing of bell-traps, dip-traps and D traps is prohibited.

**By-law 4** requires that an intercepting trap shall be fixed in every main drain or other drain which shall communicate with a sewer. The trap is to be placed within the curtilage of the building. Means of access to the intercepting trap must be provided for the purpose of cleaning, either by a separate manhole or other separate means of access.

Intercepting traps and the means of access thereto would have to be inside buildings having no forecourts, vaults or areas in front. In cases of this kind the Islington Vestry has required the manholes containing the intercepting traps to be placed under the footway, their reason for this requirement being the necessity for preventing the entrance of bad smells from manholes placed inside houses on the removal of the covers for the purpose of inspecting or clearing the intercepting traps. Under exceptional circumstances manholes have been constructed inside buildings, and the Vestry has required them to be provided with two air-tight covers, in order that smells might be excluded by the lower cover when the upper one became disarranged or damaged by the passage of people or goods over it. Great inconvenience would be caused by the cleansing of intercepting traps placed, in accordance with the proposed by-law, inside shops or houses, unless there were basements to the premises. It seems desirable, therefore,

445 OXFORD STREET, LONDON, W.

hat the proposed by-law should be modified to the extent of allowing some discretion to vestries as to the position in which the intercepting traps shall be placed in the case of buildings having neither basements, vaults, areas, nor forecourts.

The by-law contains no reference to the materials to be used in the construction of a manhole or other means of access to an intercepting trap. If passed in its present form builders will be at liberty to use whatever materials they choose for these appliances, and however improper the materials or the construction may be, no local authority will have power to interfere. Every advantage would be taken of this by those who seem to think that any quality of material is suitable for drainage-work, and who will do nothing properly except under the strictest supervision, or until a summons has been issued against them.

### COUNTY COUNCIL WORKS DEPARTMENT.

A RETURN has been prepared by the works committee of the London County Council showing the cost of works which have been completed during the half-year ended September 30, 1896, and certified. The committee state that comparatively few works were finished during the six months in question, but the total value of the work executed was about 149,000*l.*, including an amount of 11,357*l.* for jobbing works. The account for estimated works completed and certified during the half-year shows the final estimate to have been 23,218*l.*, and the actual cost 25,696*l.* The largest losses have been made on the Shelton Street dwellings and the Sandys Row Improvement; in the former case the difference between the final estimate and the actual cost being 2,607*l.*, and in the latter 345*l.* A saving is shown of 215*l.* on some work at Woolwich Ferry, and 153*l.* on the Boundary Street sewer. Mr. Adams, the new manager of the Works Department, in a report upon these works points out that in the Shelton Street dwellings there were considerable delays after the work was started in carrying it out, but the Works Department were not responsible for these delays, which enhanced the cost. The blocks of buildings were in very confined areas and separated from one another by intervening streets and houses, increasing the estimate of the cost of superintendence, lighting and watching. The summary of estimated works completed and reported to the Council since the commencement of operations by the works committee in March 1893 up to September 30, 1896, shows the final estimates to amount to 406,756*l.*, and the actual cost 403,339*l.*, being a net

balance of cost below estimate of 3,417*l.* The value at schedule prices of the jobbing works completed during the half-year ended September 30, 1896, and certified up to date, is 9,990*l.*, and the actual cost has been 8,981*l.*, showing a net balance of cost below schedule value of 1,009*l.*, which, added to the balance of cost below schedule value of works previously reported, amounting to 2,140*l.*, makes a total net balance in favour of the department of 3,149*l.* From these accounts it appears that the operations of the works committee since the commencement have resulted in a total net balance of cost below estimate and schedule value of 6,566*l.* The committee point out that, unfortunately, they have been unable to obtain certificates for certain works which have been completed during the half-year ended September 30, 1896. The works referred to are the following:—

Name and description of work.	Original estimate as passed by Council.	Manager's revised estimate not agreed to.	Actual cost.

### DUBLIN SANITARY ASSOCIATION.

THE Council met on the 25th ult. at the offices of the Association, 42 Dame Street, at 4.30 o'clock P.M. Present—The President (in the chair), Messrs. Price, Q.C., J. J. Digges La Touche, LL.D., Dr. Speedy, Dr. Newell, Dr. Francis Crawley.

The question of hospital accommodation in Dublin was before the Council, and after considerable discussion the following two resolutions were adopted:—(1) "That the Council beg to call the attention of the Corporation as the sanitary authority of the City of Dublin, to the want during the present epidemics of additional hospital accommodation for the treatment of in-

fectious cases. (2) That the Council of the Dublin Sanitary Association are of opinion that in order to relieve the congested wards of the Dublin hospitals of patients in the convalescent stage of the prevailing epidemics, the Sanitary Authority of Dublin should be urged to represent to the respective Dublin Boards of Guardians the necessity of adequate accommodation for such convalescents being provided."

### THE WIDENING OF FLEET STREET.

THE City Commissioners of Sewers have written to the Council stating that they propose, with a view to continuing the widening of Fleet Street, to acquire the freeholds of the properties between Bride Lane and Salisbury Court (Nos. 82 to 97 Fleet Street, but excluding No. 89, in respect to which the Council has already agreed to contribute), and asking the Council to contribute half of the cost of the proposed improvement. The present width of the road at this point is about 45 feet, and it is proposed to increase this to 60 feet, the cost of so doing being estimated at 170,780*l.*; but it is probable that that amount will be reduced, as the Commissioners propose by acquiring the freeholds to allow some of the short leases to run out. The committee point out that the Council has already agreed to contribute half the cost of widening Fleet Street between Ludgate Circus and Bride Lane and at No. 89, and that the Council when so agreeing had regard to the fact that the widening of Fleet Street was necessitated, not by local, but by general through traffic to and from all parts of the country, the street being one of the main thoroughfares of London. The present application is in respect of a proposed widening of the road for a length of about 216 feet. In March 1896, when the Council agreed to contribute half the cost of widening the street between Ludgate Circus and Bride Lane, the committee made reference to the present proposal, and stated "there would still remain two other portions of the street, between Salisbury Court and Temple Bar, having together a length of about 1,100 feet, which at some future time would require to be widened. It is therefore evident that the present improvement is only the commencement of a much larger scheme, which in its entirety will doubtless cost something like 1,000,000*l.* The committee now state that they are strongly of opinion that to continue the widening of Fleet Street is a desirable work, and, the Council having already admitted the necessity of the im-

provement, they had decided to recommend the Council to accede to the request of the Commissioners and contribute 85,390*l.*, one-half the cost of the improvement.

### MORLEY NEW PUBLIC BATHS.

THE Morley Corporation, following the example of their neighbours at Batley and Dewsbury, have decided to erect a set of public baths in the borough. The site selected for the purpose is a sloping piece of ground fronting on to Fountain Street, and immediately in front of the site for the proposed electric generation station. Out of the fifteen plans that were sent in, the committee having charge of the scheme have chosen those submitted by Messrs. Holtom & Fox, of Dewsbury, the firm of architects who some years ago designed the commodious bath premises at Burnley. To be built of Morley stone, the front elevation of the building will not be unattractive. In the centre, where the bath superintendent will have his home, the building is to be two storeys high; the rest of the structure will be a single storey. The manager's house will consist of a couple of bedrooms, a kitchen and a sitting-room. There will be two entrances to the baths. On the left will be the men's slipper baths—two first-class and four second—two shower baths, a needle bath, and a vapour bath. A visitor to the first-class swimming bath will also enter by this door, and, passing the pay office, beneath the superintendent's house, will turn along a short corridor to the left, where he will find the direct entrance to the bath-room. This arrangement will prevent anyone standing near the outside entrance from seeing the bathers in the swimming bath when the door of that place is opened. The length of the first-class bath will be 65 feet, the breadth 24 feet, and the depth will vary from 3 feet to 6 feet. At the end of the passage referred to is to be a second and broader corridor, and in all probability some day or other this space will be utilised for Turkish baths, though the construction of such baths is not included in the present scheme. The entrance on the right-hand side of the building will lead to the ladies' slipper baths, of which there are to be a similar number to those provided for men. Behind these baths will be the second-class swimming bath of the regulation dimensions (water measure), viz. 75 feet by 30 feet. As this bath will often be used for entertainments, a spacious gallery has been provided, running the greater part of the way round the room. Dressing-boxes of wood, with slate partitions, are to be arranged on two sides

906  
80/-  
With top centre  
and brass shoe any size.

This Floor Spring is suitable for any sized door, and can be regulated to suit any force required.

The box is watertight and weatherproof, a distinct advantage when fixed in Banks, Board Schools, Libraries, and similar places, where the floors are frequently washed down.

It is also sent complete with an outer box to fix into floor, to facilitate the spring being taken out when necessary.

Working Models of these and other Specialties may be seen at our newly-fitted London Showrooms, 57 HOLBORN VIADUCT, E.C. Architects and Buyers are respectfully invited to inspect same.

of the room. These apartments will be about 3 feet 9 inches square, and there will be small doors to them. Both of the swimming baths are to be lined with glazed bricks, and adjoining each will be a small soap-bath. Taking advantage of the sloping character of the site, the architects have arranged to sink the second-class bath a little lower than the smaller one, so that in case of scarcity of water the contents of the latter might be run off into the second-class bath. In winter only the smaller bath will remain open, and a suggestion has been made that the second-class bath might be covered over and used as a gymnasium. Nothing, however, has been definitely decided in regard to this matter. For the washing and drying of towels there will be a laundry immediately behind the manager's house and between the two swimming baths. The estimated cost of carrying out the scheme of the Corporation is 6,000*l*.

### THE DRAINAGE OF LONDON.

At the ordinary meeting of the Institution of Civil Engineers on February 23 two communications on "The Main Drainage of London," by Messrs. W. Santo Crimp and J. E. Worth, and on "The Purification of the Thames," by Mr. W. J. Dibdin, were read.

In the first paper were described in detail the works carried out in London for the purpose of intercepting the sewage, which formerly passed directly into the river, and conveying it to outfall works at Barking and Crossness, about fourteen miles below London Bridge. The works designed by the late Sir J. W. Bazalgette, and carried out by him for the late Metropolitan Board of Works, comprised the construction of about 110 miles of intercepting and storm-relief sewers, the former having a final discharging capacity of about 540 million gallons per day, about 2·7 times the present dry weather flow. There were two main pumping-stations on each side of the river, with machinery of an aggregate of 3,000 horse-power capable of pumping 500 million gallons per day, and a like number of storm-water pumping-stations capable of pumping directly into the river 150 million gallons per day. The latter were used for preventing flooding in the lower parts of the Metropolis when a heavy fall of rain occurred at or about the time of high water, when the storm outlets were closed by the tidal water. The works undertaken by the London County Council to improve the pumping machinery by compounding the steam-engines at the principal pumping-stations were also described.

The outfall works for the purification of the sewage, the dry-weather flow of which now exceeded 200 million gallons per day, were next dealt with. They consisted of settling-tanks and their accessories for the chemical treatment of the sewage, and the means for removing the sludge produced to the German Ocean. The tanks at Barking contained 20 million gallons, whilst those at Crossness contained 31 millions. The sludge, amounting to 2,169,000 tons in 1895, was discharged into the open sea at a distance of about fifty miles from the works by a fleet of six steamers, each having a carrying capacity of 1,000 tons. The experimental filters for dealing with the effluent, and capable of effecting a purification of 78 per cent. were mentioned. The question of flood discharges from an area fully built over was referred to, and the details relating to an area of 160 acres were given; it appeared that the flow had reached a rate equal to 2·5ths of an inch per hour. The bearing of this question upon the "Separate" system was next referred to, and it was stated that, so far as London was concerned, the system was impracticable. Nine hundred and twenty men were employed in the continuous disposal of the sewage, which amounted to 75,000 million gallons per annum, the working expenses in 1895 being 104,000*l*., or about 5½*d*. per head per annum. The works now disposed of the sewage from a population of 4½ millions. The results had been the interception from the Thames of vast quantities of filth, which formerly rendered it offensive, and the conversion of the river into a relatively pure estuary.

In the second paper, the author described first the steps that had been taken in accordance with the scheme adopted by the late Metropolitan Board of Works for the treatment of the London sewage at the outfalls at Barking Creek and Crossness; secondly, the effect of that work in freeing the river from the raw sewage; and thirdly, the best method of effecting still further improvement.

On arrival at the Northern Outfall Works the sewage was screened to remove all large particles, such as rags, &c. After receiving the proper quantity of lime the sewage passed the iron-water station where the solution of iron-sulphate was added. The iron salt was dissolved in a tank of water heated by a steam coil, and the concentrated solution was sufficiently diluted and passed into the already limed sewage. The precipitation was completed in the channels, thirteen in number, about 30 feet wide, 15 feet in height and having an average length of 1,000 feet. The sludge was discharged from these to the sludge-settling channels by sweeping the deposit

through culverts to the receiving-chamber at the engine-house, whence it was pumped into the settling channels. On its way to these the sludge was again passed through gratings to collect rags, &c., which might have escaped the first filth-gratings. The quantity of solid matter extracted by the combined action of these double sets of gratings was between 80 tons and 100 tons per week. A destructor-furnace was built close to the filth hoist for calcination of the refuse. After the sludge had settled and the top-water had been drawn off by means of lowering siphons, the sludge was let into the storage-tanks under the settling-channels, whence it was pumped to the ships. The water drawn from the settled sludge was separately treated with lime and iron, and after such treatment it was allowed to settle in the sewage-precipitation channels.

At the Southern Outfall Works, Crossness, the precipitation works were more compact. Practically the whole of the lime was in solution. The iron water was made at Crossness by the simple agitation of the crystals of iron salt with water in an ordinary mixing-mill from which the rollers were removed, stirring-arms being substituted in their place, the effect being equally efficacious with that of the steam-coil at the Northern Outfall Works. The methods of collecting the sludge, settling it, and loading the ships were practically identical with those at the Northern Outfall.

The discharge of the sludge took place in the Barrow Deep, commencing at a point 10 miles east of the Nore, about halfway between the Swin Channel and the Princes Channel. As the sludge was discharged 10 feet under water, and was thus agitated with the sea-water by the action of the twin-screws, the diffusion of the sludge in the water is very complete, so much so that its visible effect was soon lost. The heavy matters soon separated by subsidence, and the animal and vegetable debris was rapidly consumed. Although some 10,000,000 of tons of sludge had now been deposited, the most careful examination failed to detect more than the merest trace, either in dredgings or on the sandbanks, which were now as clean as in 1888. The cost amounted to about 44d. per ton of sludge.

The average character of the sewage before and after treatment was set out in tables of monthly averages of daily analyses of samples taken every two hours, day and night, at each outfall during the year 1894. At Crossness, in consequence of the better solution of the lime-water, there was a reduction of the matters held in solution of 17 per cent., a result which agreed closely with the experiments by the author in 1887. At the Northern Outfall the results were not yet so good, but this would

doubtless be remedied as soon as the new liming station was erected.

Tables showing the averages of daily analyses of the river-water since 1885 were given, and showed that the degree of aeration at high water had increased from 17.4 per cent. in 1887 to 55.5 per cent. in 1894; and this improvement has been accompanied by a large reduction in the quantity of free ammonia.

### NEW PIERHEAD BATHS, LIVERPOOL.

THE baths committee of the Liverpool City Council have approved of plans prepared by Mr. W. Court for the new Pier-head Baths. The front entrance will be facing the George's Dock, and approached by three or four steps to a sort of plateau. The ladies' entrance to the baths will be to the left and the gentlemen's to the right, the ticket office being in a central position. All visitors will have to pass through turnstiles. There will be a spacious entrance-hall about 37 feet square, with a grand staircase leading to the upper portions of the building. On the left side will be a lift to take bathers to the different parts of the building open to them. The superintendent's office is also adjacent. On the left of the entrance is the gentlemen's plunge-bath, so arranged that there is no possibility of anyone seeing into it, and this improvement is sure to be appreciated by swimmers and visitors. A spacious corridor will extend right around the building. There will be eighty-one dressing-boxes, each 4 feet by 3 feet 6 inches, and dressing-rooms—four in number—each averaging 15 feet by 9 feet, two being provided with fireplaces. The conveniences will be of the most perfect kind, and so constructed that bathers only will have access to them from the parapet of the bath. The plunge-bath will be one of the finest in the kingdom, being 100 feet by 44 feet. Close to the plunge-bath there will be hot and cold "needle" baths, and between the parapet and the dressing-boxes underneath the gallery ample space is allowed for efficient heating and ventilation; in fact, the principal feature aimed at is a sufficiency of light and air. The boilers will be in the basement. On the occasion of galas the entrance for competitors will be entirely distinct from that of the spectators.

To the right side of the entrance-hall will be the ladies' plunge-bath 60 feet by 30 feet, and this will be arranged with a sort of double parapet, high and low, the higher one enabling the bathers to avoid the splashing of water which seems to be a

J. STANNAH,  
20 Southwark Bridge Road, London, S.E.

characteristic of female bathing. The dressing-rooms will be comfortable and afford good accommodation, each room in size averaging about 16 feet by 15 feet. There will be dressing accommodation for something like 150 bathers.

On the ground floor at the north-west corner close to the bridge leading to the landing-stage provision is made for a public café, with entrance and lift giving access to the upper floors. The café, however, will have no connection whatever with the baths. On the first floor there will be a gallery for seating at least 1,300 people and a promenade giving space for an additional 700. For the purpose of safety there are special exits, while the entrance is from the main hall and by the lift. A gentlemen's smoke-room is provided on the first floor. This will be 46 feet by 15 feet, and as it will face the river it will be a favourite portion of the premises. Moreover, arrangements will be made for the supply of refreshments from the café. On this floor are also situated, according to the plans, the ladies' private baths, including five slipper-baths with seven dressing-rooms, some of the latter having fireplaces, Russian baths, sitz baths, needle-bath, Aix-les-Bains and wave baths, with dressing-rooms. There will be a wide staircase from the door to the plunge-bath, so that if the dressing-rooms on the lower floor ever become congested accommodation could be found for lady bathers on the second floor. Immediately over the entrance is a spacious cooling-room for the use of ladies, and this will be approached directly by lift from the plunge-bath.

Ascending to the top floor, there are found on the left side just over the gallery to the plunge-bath gentlemen's private baths, comprising six ordinary slipper-baths with twelve dressing-rooms, thus economising space and at the same time giving as much light and air as possible. In addition there will be three vapour-baths, one Russian and wave, a sitz, Aix-les-Bains and needle and one Roman bath similar in every respect to those provided at Harrogate and other fashionable watering-places; as a matter of fact, the baths will be such as are to be found in the various hydropathic establishments throughout the country. There is space for a gentlemen's cooling-room, also for a complete suite of Turkish baths with twelve dressing-rooms and twelve divans. An arrangement which will meet with most appreciation from swimmers is that enabling those who have used the Turkish or private baths to descend to the plunge-bath by means of a special lift. Engineer's and superintendent's offices and residence are likewise arranged for, and on each floor there is accommodation added to the café, including a commodious smoke-room

facing the river. At the top of the whole building there will be a promenade, whence a view will be obtained of the estuary of the Mersey and the principal objects of interest on the Lancashire and Cheshire sides of the river. Throughout the building oriel windows will be used, and whilst every effort has been made to plan baths that shall meet all requirements that shall be acceptable to the public and be profitable to the city, the comfort of the bathers has been thoroughly considered and carefully provided for. The buildings now planned, it is estimated, will cost about 35,000*l.*, and it is believed that from the rental of the café a yearly income of 300*l.* could be secured.

#### NORTH BRIDGE STREET IMPROVEMENT, EDINBURGH.

At the last meeting of the Edinburgh Town Council a report was presented from the Lord Provost's committee which recommended approval of elevations and plans of buildings to be erected on both sides of North Bridge Street by the authors of the design adjudged first (Messrs. Scott & Williamson), and failing satisfactory offers from outside parties, recommended that the Corporation should undertake the work of reconstruction, and craved an order to instruct the preparation of working plans meantime for the corner blocks at the south end of the bridge, to obtain estimates for the work, and report. The Lord Provost, in moving the adoption of the recommendation of the committee, stated that the committee were unanimously of opinion that the plans should be accepted, so far as the elevations were concerned. There might be some alterations internally, and perhaps even with regard to the height of the roofs, but these matters would come up again when the plans were finally adjusted. They had yet to consider how the basement flats could be so advantageously utilised as to bring out the best possible rental and the most prominent architectural features of the buildings. In the meantime they desired only to have the general approval of the elevations of the plans. This matter would come up in connection with the Bill they were prosecuting in Parliament, and they would then have to consider whether they should build this street themselves or sell the feus to somebody else. Mr. W. S. Brown pointed out that there was a standing order which prevented any of their officials doing private work. While they were all delighted that one of the young men in the superintendent's office, Mr.

Williamson, had been successful in securing the first prize, they should have some indication how this work was to be carried out, and whether he would remain in the service of the city while the work was being executed. The Lord Provost said that no doubt Mr. Williamson would look after his own interests. The recommendation of the committee was unanimously adopted.

### LANCASHIRE FARM BUILDINGS.

IN his annual report to the Bury Rural District Council just issued, Dr. W. H. Barr, hon. medical officer to the infirmary, writes:—"Many farms in the district have been visited and found, as usual, very much wanting. It is painfully depressing to visit these overcrowded cow-houses and shippens. With few exceptions they are dirty, stuffy and dark. I have brought several cases of insanitary farms before the Council, and orders have been served upon landlords and tenants to abate nuisances. But little amelioration of a permanent character can be hoped for so long as landlords pay so little attention to structural effects and the needs of the tenants. More legal powers are necessary to enable officers of health and rural sanitary councils to deal with the owners of these disgraceful buildings. Considering the importance of this subject, and its bearing on the milk supply of the community, I think the regulations as to dairies, cowsheds and milk shops recently adopted by the city of Manchester well worthy of application to our district, and if the landlords wish to commemorate Her Majesty's diamond jubilee, they cannot confer a greater boon upon suffering animals and mankind than by rebuilding and reorganising the sanitary arrangements of their dilapidated farmsteads."

### ELECTRIC LIGHTING IN EDINBURGH.

AT the last meeting of the Edinburgh Town Council a report of the electric-lighting committee recommending that the charge for electric energy as from May 15 next be 4d. per unit, the charge for each lamp 16l. per annum, and the charge for motor power 2½d. per unit was considered.

Mr. Mackenzie, convener, in moving approval of the report, said he should like the Council to agree to still further reduce the price for motor power to 2d. It would not affect the result very much, and they wanted to encourage, if possible, a day

service. After the most successful first year's working of any electric-lighting station ever started in this country, the company began the current financial year with 452 customers and what was equivalent to 57,690 8 candle-power lamps. They were now within measurable distance of the end of the second year, and were able to estimate pretty nearly that on May 15 next they should begin the third year's working with 830 customers, having equal to 100,000 8 candle-power lamps joined on. This continued progress was most satisfactory, and as far as they could judge, was likely to continue for some time. The amount of light supplied during the current year shows an equally large increase, for while the number of Board of Trade units sold during 1895-96 amounted to 888,335, the number of units sold during the current year ending May 15 next will amount to nearly, if not quite, 1,700,000—an increase of over 90 per cent. In regard to the financial results, they were equally successful. They would not forget that the price was reduced as from May last from 6d. to 5d. per unit, continuing the large discounts as formerly. Meter rents were abolished, and public lighting was reduced from 20l. to 18l. per lamp per annum. The results were that their income would be about 26,100l., which was 2,250l. above their estimate; their total expenses would be 19,250l., which was, even with their much larger output, 950l. less than the estimate, thus leaving the very handsome balance of 6,850l. of income over expenditure for the year instead of 3,650l. as estimated. That was the result of this year's working, which the Council might take as practically correct, though there were yet a few months of the year to run. He now came to the estimated results of the coming year 1897-98, beginning in May next. The engineers had gone into this matter most carefully and thoroughly, and from the marvellous accuracy and caution of Professor Kennedy's forecasts in the past they might depend upon his figures being equally reliable in this case. It was estimated that in the coming year the total output would not be less than 2,550,000 Board of Trade units, that being 45 per cent. increase. It might be a good deal more; he thought himself it would be more like 60 or 80 per cent. of increase. The total costs for 2,550,000 units, including 16,135l. as estimated by the Chamberlain for standing charges, the engineers put at 28,200l. The total revenue they estimated at 32,120l., counting the charge for private consumers at 4d. per unit with discounts, and the charge for public lighting at 16l. per lamp, assuming that the number would be increased 80 or

# THE NEW EXPANDED METAL

*Mesher from ¼th in. to 6 in. wide. Strands from 24 B.W.G. to ⅜th in. thickness of steel.*

**FOR BUILDING CONSTRUCTION**, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

**FOR SOLID PLASTER PARTITIONS**, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

**FOR FIREPROOF LATHING**, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

**FOR CONCRETE FLOORS WITH EXPANDED METAL**.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

**FOR EXTERIOR WALLS OF BUILDINGS**.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

**FOR FENCING, TREE GUARDS, WINDOW GUARDS**, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

**ORNAMENTAL. STRONG. CHEAP.**

**OTHER USES FOR EXPANDED METAL**.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away.

Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

**BRASS, ALUMINIUM**, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

**CATALOGUES AND PRICE LISTS** can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

**THE EXPANDED METAL COMPANY, LTD.,**

**39 UPPER THAMES STREET, LONDON, E.C.**

Telegraphic Address, "Distend, London."

Works—WEST HARTLEPOOL.

Telephone No. 1829.

ALL RIGHTS RESERVED BY THE EXPANDED METAL COMPANY, LTD.

90 lamps during the year. They thus contemplated a balance of income over expenditure for the year, after the present very large reduction in price, of 3,885*l.*, or say 4,000*l.* It certainly would not be less; probably it would be 2,000*l.* or 3,000*l.* more. As there was a feeling existing in the minds of some members of the Council that the public lighting was too highly charged, and that a proportionate reduction was not being made, he would point out the exact state of the case. Assuming that the Council sanctioned an increase of 90 lamps for the year, and taking the number sanctioned already at 500, they might expect an average of 545 burning during the whole year, and for this they asked 16*l.* per lamp, or a total of 8,720*l.* For the upkeep of these 545 lamps they should have to expend 692*l.* in carbons, 1,635*l.* in trimmers' wages, and on repairs and maintenance 200*l.*, a total of 2,527*l.*, leaving them 6,193*l.* for the current, sinking fund, interest and management. The number of units required for the 545 lamps during the year was about 900,000; for this the committee got a little under 1*3*/<sub>4</sub>*d.* per unit, 6,193*l.* in all, while for the private lighting they got an average of about 3*3*/<sub>4</sub>*d.* per unit, or, taking public and private lighting together, nearly 3*4*/<sub>4</sub>*d.* per unit. This would show whether the electric-lighting department was overcharging for street lighting. For what was nothing less than the extraordinary success of the electric-lighting undertaking they were largely indebted, first, to their engineer-in-chief, Professor Kennedy, who had shown himself, what, indeed, he was acknowledged to be, one of the ablest and most reliable electrical engineers in the country, for whose prudence, sagacity and foresight those who knew him had the greatest possible admiration; secondly, to Mr. Monkhouse, who had, now left them, and to Mr. Newington, who had in a quiet, unostentatious manner done an enormous amount of difficult work during the last nine months. He was devoted to his work and had been ably supported by the members of his staff. It should not be forgotten that the introduction of the higher voltage just in progress had been largely instrumental in enabling them to attain such successful results, and consumers should bear in mind the fact and not impede the completion of this desirable piece of work. They intended shortly to ask the Board of Trade for its official confirmation of the system as a high voltage one.

Baile Anderson suggested a further reduction of the cost of public lighting to 15*l.* per lamp, so that the ratepayers might more largely participate in the success of the venture, of which originally they had taken all the risks.

Mr. Mackenzie pointed out that at the present moment they had a dead loss of 12*s.* 8*d.* per lamp, and it was almost literally true of them as of the old woman who sold all her oranges below cost price and trusted to the quantity disposed of to recoup her.

The motion was approved.

## PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

### APPLICATIONS FOR PATENTS.

4091. Alfred Julius Boulton, for "Improvements in or relating to bricks or blocks for use in the construction of chimneys, flues and other shafts."

4146. Hugh Donald Fitzpatrick, for "Improvements in sash-locks or fasteners."

4159. Robert K. Brown, for "Improvements in automatically locking sash-holders."

4178. Daniel Wesley Harper, Thomas Ripley Tarnsworth and Robert Leedy Matthews, for "Improvements in and relating to cash registers and recorders."

4199. Herbert Henry Barnett, for "Improvements relating to casement windows."

4399. George Pitt, for "Improvements in brick-kilns."

4455. William Speirs Simpson, for "Improvements connected with Venetian blinds and in means for fixing them when closed."

4618. William George Williams and Samuel Taylor, for "A new medium for and improvements in decorating surfaces."

4621. Arthur Grafton Herbert and Francis Robert Baker, for "An improved blind-cord rack-pulley."

4652. James George Cox, for "Improvements relating to the laying of drain-pipes."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 73 Chancery Lane, London, W.C.

SHENLEY HILL SILVER AND FILTER SAND PITS

## LEIGHTON BUZZARD CEMENT AND BUILDING SAND.

ALL PURE GRIT. NO SCREENING OR WASHING REQUIRED.  
ALL LABOUR SAVED. FIT FOR IMMEDIATE USE.  
A VERY SUPERIOR QUALITY.

Free on Rail or Canal at Leighton Buzzard. All communications should be addressed to the SOLE PROPRIETOR OF THE PITS,

**JOSEPH ARNOLD,**

Contractor to H.M. Government.

Architect and Contract Reporter.

## EDITORIAL NOTICES.

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

## NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

*For Advertisement Scale, see page xv.*

## COMPETITIONS DECIDED.

THE NEW HIGHER GRADE SCHOOL, SCARBOROUGH.—Mr. Robson, F.S.A., architect to the Education Department, who was asked by the Scarborough School Board to judge the plans sent in for the erection of the new higher school, has made his award. The first place is taken by Messrs. Hall, Cooper & Davis, Westborough, Scarborough; the second place by Messrs. Demaine & Brierley, of York; and the third by Messrs. Marshall & Dick, of Newcastle-on-Tyne. The competition was an open one, and about forty sets of plans were sent in from all parts of the country.

THE PROPOSED WESLEYAN COLLEGE, SCARBOROUGH.—Five sets of plans were sent in by local architects for the premiums offered, viz. 50l. and 25l., in connection with the proposed Wesleyan College on the Weaponess Estate, South Cliffe. The award has been made, the first premium being awarded to Messrs. Hall, Cooper & Davis, Westborough, Scarborough, and the second to Messrs. Tugwell & Barry, Westborough, Scarborough. This competition was confined to local architects, and five sets of plans were deposited.

## CONTRACTS OPEN.

ABERAMAN.—March 13.—For alterations and additions to the Pen-y-lan Inn. Mr. T. Roderick, architect, Ashbrook House, Clifton Street, Aberdare.

ABERDEEN.—March 16.—For erection of stables at Whitehouse. Messrs. Jenkins & Marr, architects, 16 Bridge Street, Aberdeen.

ABOYNE.—March 18.—For erection of an isolation hospital. Messrs. Jenkins & Marr, architects, 16 Bridge Street, Aberdeen.

AISKEW.—For erection of three cottages in Aiskew. Mr. Robert Imeson, land agent, Masham.

ALFORD.—March 27.—For erection of an epidemic hospital. Messrs. James Duncan & Son, architects, Turriff.

ALNWICK.—March 18.—For alterations and additions to Alnwick Castle dairy farm buildings. Mr. Kyle, Estates Offices, Alnwick Castle.

ARGYLLSHIRE.—March 20.—For erection of three cottages at Gigha. Mr. Hugh Douglas, Gigha, Argyllshire.

BARNET.—March 24.—For erection of foreman's cottage, fire-engine house, stable, boundary walls and gates, Tapster Street. Mr. H. W. Poole, clerk, Barnet.

BATLEY.—For erection of the Stubley memorial wing to the Batley Technical School. Mr. Harry B. Buckley, architect, 8 East Parade, Leeds.

BATLEY.—For erection of a villa residence in Deighton Lane, Healey. Mr. Harry B. Buckley, architect, 8 East Parade, Leeds.

BELFAST.—March 20.—For erection of a masonic hall on Crumlin Road. Mr. J. H. Gault, 5 Agnes Street.

BELPER.—March 13.—For erection of moulding and fitting shops, covering nearly 1½ acres (with the exception of the iron-work to roof), on the Derby Road. Mr. Maurice Hunter, Belper.

BLACKPOOL.—March 22.—For erection of cemetery registrar's house on the southerly side of new road, opposite the cemetery. Mr. T. Loftos, town clerk.

BRADFORD.—March 15.—For erection of six houses at Prospect Road. Mr. J. H. Dixon, architect, 90 Heap Lane, Bradford.

BRADFORD.—For alterations and additions to the Robin Hood Inn. Mr. John Jackson, architect, Barry Street, Bradford.

BRADFORD.—March 17.—For fitting-up portions of the Exchange Restaurant. Messrs. Milnes & France, architects, Bradford.

BRADFORD.—March 15.—For erection of four through houses in East Parade. Mr. Abm. Sharp, architect, Albany Buildings, Market Street, Bradford.

BRECON.—March 15.—For erection of cattle stalls, &c., in the cattle markets. Mr. Rhys Davies, borough surveyor, Brecon.

BURNWOOD.—March 16.—For erection of four attendants' houses at Burnwood Asylum. Mr. Walter H. Cheadle, architect, Stafford.

CAMBERWELL.—March 15.—For wood-block flooring at the South London Art Gallery and School in course of erection in Peckham Road. Mr. C. William Tagg, vestry clerk, Vestry Hall, Camberwell.

CARDIFF.—March 22.—For conversion of dwelling-house property into shops in Cowbridge Road. Mr. W. H. Dashwood Caple, architect, 1 St. John's Square, Cardiff.

CARRICKFERGUS.—March 15.—For building a masonic hall. Mr. James Boyd, Town Hall, Carrickfergus.

CATERHAM.—March 17.—For erection of a nurses' home at the Caterham Imbecile Asylum. Mr. Edwin T. Hall, 57 Moorgate Street, E.C.

COLCHESTER.—March 15.—For taking up old and putting down new floor to dining-hall at the workhouse. Mr. G. H. Page, architect, Trinity Chambers, Colchester.

CORNWALL.—March 17.—For the erection of a classroom at St. Enoder national school. Rev. W. Horsburgh, St. Enoder Rectory, Grampound Road.

DARLINGTON.—For erection of stabling, &c., in Tubwell Row. Mr. C. N. Coates, Stapleton, Darlington.

DARLINGTON.—March 15.—For erection of a parish hall for the church of St. Cuthbert. Messrs. Clark & Moscrop, architects, Darlington.

DEVONPORT.—March 18.—For structural alterations at workhouse infirmary. Mr. Albert Gard, clerk, 19 St. Aubyn Street, Devonport.

DEWSBURY.—March 15.—For erection of dry fence wall in Halifax Road. Mr. H. Dearden, borough surveyor, Town Hall.

DORCHESTER.—March 13.—For additions and repairs at the Junction Hotel. Mr. A. L. T. Tilley, architect, 16 Cornhill, Dorchester.

DUNSTABLE.—March 18.—For repairs, renovations and alterations of town hall. Mr. C. Crichton S. Benning, town clerk.

DURHAM.—March 17.—For erection of house, &c., in Queen Street, Blackhill. Mr. George Thomas Wilson, architect, 121 Durham Road, Blackhill.

EBBW VALE.—March 15.—For erection of a school to accommodate 157 children near Steelworks Houses, with outhouses, boundaries and playgrounds. Mr. Geo. Rosser, architect, Victoria Buildings, Abercarn.

FEATHERSTONE.—March 25.—For erection of assembly-rooms, market hall and club. Messrs. Gafside & Keyworth, architects, Pontefract.

FLEET.—March 27.—For restoration of roof of nave and north and south aisle roofs of Fleet Church. Mr. W. M. Fawcett, architect, 1 Silver Street, Cambridge.

GAINSBOROUGH.—March 15.—For erection of 100 wards, mortuary, boundary walls, stone and iron stairs, and new conveniences at the workhouse. Messrs. Eyre & Southall, architects, Gainsborough.

GALGATE.—March 13.—For erection of police station. Mr. Henry Littler, architect, 21 Pitt Street, Preston.

GIRLINGTON.—March 15.—For erection of five houses and shops and two houses. Mr. J. Hainsworth, plumber, 376 Brownroyd, Thornton Road.

GLASGOW.—For fitting-up summer show on April 21 and 22, for the Glasgow Agricultural Society. Mr. Alexander Russell, secretary, 175 West George Street, Glasgow.

GLASS HOUGHTON.—March 15.—For erection of Board schools at Cutsyke. Mr. George F. Pennington, architect, Bridge Street, Castleford.

GLOUCESTER.—March 25.—For erection of three show-rooms, with a retaining wall and wrought-iron palisading, and for erection of the walls of the proposed bull ring in Market Parade, and wrought-iron palisading. Mr. R. Read, city surveyor, Guildhall, Gloucester.

GREAT YARMOUTH.—March 18.—For erection of two houses on the cliffs. Mr. H. Dudley Arnott, architect, High Street, Gorleston.

HALIFAX.—March 20.—For erection of a warehouse, with stabling, &c., in Union Street South. Mr. Arthur George Dalzell, architect and surveyor, 15 Commercial Street, Halifax.

HALIFAX.—March 24.—For additions and extensions at Washer Lane dyeworks. Messrs. R. & R. E. Horsfall, architects, 15 George Street, Halifax.

HUBB.—March 16.—For erection of a farmhouse and out-buildings. Mr. W. H. Beevers, architect, 25 Bond Street, Leeds.

HUDDERSFIELD.—March 18.—For erection of a shed at the Archill and Cudbear Works, Hillhouse Road. Messrs. John Kirk & Sons, architects, Huddersfield.

HUDDERSFIELD.—March 18.—For erection of a bottling store. Mr. J. Berry, architect, 9 Queen Street, Huddersfield.

HULL.—For pulling-down and clearing-away old material of three houses, corner of Norfolk Street and Beverley Road. Messrs. Gelder & Kitchen, architects, 76 Lowgate, Hull.

HUNSLET.—For erection of a four-storeyed warehouse in Hunslet Road. Mr. John E. Leak, architect, Hunslet.

HUNSLET MOOR.—For erection of eight houses in Arthington Avenue. Mr. W. Mason Coggill, architect, Beech Grove, Stourton.

IRELAND.—March 20.—For erection of a church at Cashilard. Mr. E. J. Toye, architect, Strand, Derry.

IRELAND.—March 20.—For erection of new bank at Portrush. Mr. Vincent Craig, architect, 5 Lombard Street, Belfast.

IRELAND.—For erection of a creamery building at Anna, near Linsagry Station. Messrs. J. P. Evans & Co., 131 George Street, Limerick.

KING'S LYNN.—March 20.—For alterations and repairs to the Prince of Wales Inn. Mr. George Thorpe, architect, Exchange Square, Wisbech.

KINSALE.—March 15.—For additions and alterations to the Convent of Mercy. Mr. Saml. F. Hynes, 41 South Mall, Cork.

LANCHESTER.—March 17.—For erection of three houses, &c. Mr. Geo. Thomas Wilson, architect, 121 Durham Road, Blackhill.

LANGTOFT.—March 20.—For restoration of the roof of north aisle of parish church. Mr. J. C. Traylen, diocesan surveyor.

LEEDS.—For erection of a boot factory in Compton Road, Burmantofts. Mr. W. Mason Coggill, architect, Beech Grove, Stourton.

LEEDS.—March 16.—For refronting the east and south elevations of the Oxford Place Chapel, with other alteration and remodelling. Messrs. George F. Danby, Great George Street.

LEEDS.—March 20.—For erection of purifier-house and eight purifiers at the Meadow Lane Gasworks. Mr. R. H. Townsley, general superintendent, Municipal Offices, Leeds.

LEEDS.—March 24.—For erection of a police station and branch free library at Upper Wortley. City engineer, Municipal Buildings.

LIMERICK.—March 13.—For erection of creamery buildings at each of the following places:—Oola; Kilmihill, co. Clare; Effin, Charleville, co. Limerick. Mr. W. Stokes, Mulgrave Street, Limerick.

MANCHESTER.—March 22.—For construction of new steps from Store Street to Aqueduct Street, and the formation of a new gateway and roadway to works of yard in Aqueduct Street. The City Surveyor (Improvement and Buildings Departments), Town Hall.

MANSFIELD.—March 17.—For erection of an infirmary for sixty-eight beds, a maternity ward for eight beds and other works at the workhouse. Mr. R. F. Vallance, Mansfield.

THE LARGEST & BEST VARIETY OF FANLIGHTS & SASH OPENERS, &c., to suit all requirements, via details of work and price, to work by means of the Vertical Screw Rod and Regulator, or Cord.

SPECIALTIES—Door Springs, Fanlight Openers and Gear, Ventilators, Locks and Furniture, Builders' General Ironmongery, Iron Casements and Frames, Architectural and other Metal Work, &c., &c.

GUARANTEED BEST MATERIAL AND FINISH.

LOW PRICES. SAMPLES AND ESTIMATES SUBMITTED.

The New Impregnable Patent Bolts and Fastenings for Casements, Doors, Gates, &c., with Handles and Keys for one or both sides.

PANIC EXIT BOLTS,

APPROVED BY THE LONDON COUNTY COUNCIL.

THE "XIT,"

ROBT. ADAMS' PATENT.

THE "EXODUS,"

ARTHUR W. ADAMS' PATENT.

No. 190. Solid Section Tongue Bolt, Triple Action, Self-Locking, Weather and Thief Proof, Neat, Simple, and Strong.

ROBT. ADAMS, Building Trades Emporium, 67½ Newington Causeway, London, S.E. [Telegrams, "Robert Adams, London."]

MIDDLESBROUGH.—March 15.—For erection of a house in Clareville Road, Grove Hill. Mr. J. Mitchell Bottomley, architect, 28 Albert Road, Middlesbrough.

MIDDLESBROUGH.—March 16.—For alterations and new mahogany shop fronts to premises in Newport Road. Mr. Walter G. Roberts, architect, 61 Albert Road, Middlesbrough.

MIDDLESBROUGH.—March 22.—For erection of an entrance lodge at the new cemetery, Linthorpe. Mr. Frank Baker, borough engineer, Municipal Buildings, Middlesbrough.

MONTGOMERY.—March 31.—For erection of the Newtown county intermediate school. Mr. H. Teather, architect, Andrew's Buildings, Queen Street, Cardiff.

MORLEY.—March 16.—For erection of a club building in Fountain Street. Mr. S. B. Birds, architect, 47 High Street, Morley.

NEW BROMPTON.—March 16.—For erection of a cookery centre at Balmoral Road. Mr. E. T. Atchison, clerk, 8 Waterloo Road, New Brompton.

NEW TREDEGAR.—March 12.—For erection of seven houses on the Gasfield, Tirphil, and four houses on the Greenfield. Mr. George Kenshole, architect, 26 Duffryn Terrace, New Tredegar.

NORTHUMBERLAND.—For erection of new Traveller's Rest Hotel at Blyth. Mr. Savage, 12 Grey Street, Newcastle.

NORTHWOLD.—For reseating the body of the Northwold Wesleyan Chapel in pitch-pine. Mr. Henry Bovill, auctioneer, Northwold, Brandon.

OLD TRAFFORD.—March 24.—For erection of buildings for refuse destructor and sanitary works. Mr. John Bowden, architect, 14 Ridgefield, Manchester.

OMAGH.—March 20.—For erection of labourers' cottages. Mr. William Cathcart, executive sanitary officer, Workhouse.

OSWESTRY.—March 17.—For erection of stone wall in Roft Street, and construction and erection of iron sheep pens in Smithfield. Mr. R. O. Wynne-Roberts, borough surveyor, Oswestry.

OVENDEN.—March 25.—For erection of pair of semi-detached dwelling-houses in Shay Road. Mr. Medley Hall, architect, 29 Northgate, Halifax.

PONTYPRIDD.—April 3.—For erection of school to accommodate 320 boys, 320 girls and 485 infants in the Llan Wood. Mr. A. O. Evans, architect, Post Office Chambers, Pontypridd.

PORTSMOUTH.—March 23.—For erection of a public elementary school in George Street, Buckland, to accommodate 1,284 children. Mr. G. C. Vernon-Inkpen, architect, 75 King's Road, Southsea.

PUDESEY.—For alterations to Waterloo Inn and shop premises at Waterloo Road. Mr. John Jackson, architect, Barry Street, Bradford.

QUEENSBURY.—March 15.—For erection of Board schools, out-offices, boundary-walls and forming of playgrounds at Fox Hill. Messrs. John Drake & Son, architects, Winterbank, Queensbury.

ROCHDALE.—For erection of a dwelling-house in Shaw Street. Mr. Norcliffe Mills, architect and surveyor, 67 Lord Street, Rochdale.

SCOTLAND.—March 15.—For erection of a mission hall in Bonnyrigg. Mr. David Bett Tod, Bonnyrigg.

SHEFFIELD.—March 15.—For erection of police station-house and cells. Mr. J. Vickers Edwards, county surveyor, Wakefield.

SHEFFIELD.—March 31.—For erection of public baths at the corner of Sutherland Road. Mr. Charles F. Wike, City Surveyor, Town Hall, Sheffield.

SHEFFIELD.—March 16.—For erection of a department for girls, together with accommodation for cookery and manual training classes, and additions and alterations to the infants' and junior mixed departments at Gleadless Road Schools. Mr. C. J. Innocent, architect, 17 George Street, Sheffield.

SHEFFIELD.—March 27.—For erection of drapery establishment covering about three-quarters of an acre. Messrs. Flockton, Gibbs & Flockton, architects, 15 St. James Row, Sheffield.

SHEFFIELD.—April 3.—For erection of roof, principals, slate laths, and cast-iron guttering for retort-house at Grimesthorpe Station. Mr. Hanbury Thomas, Commercial Street, Sheffield.

SIDDAL.—March 13.—For erection of two houses. Messrs. Jackson & Fox, architects, 22 George Street, Halifax.

WINWICK.—March 13.—For erection of two entrance lodges and twelve cottages for proposed new asylum. Mr. Fred. C. Hulton, clerk, County offices, Preston.

A SERIOUS accident occurred at Newcastle on Friday last, when an old building in Sandgate gave way, killing four men and injuring three others. It was an old beerhouse, which was being pulled down and rebuilt. The walls suddenly collapsed. Many of the workmen escaped, but nine of them were buried, and when they were extricated four of them were found to be dead.

A NEW school erected by the Cathcart School Board at Mount Florida, Glasgow, has just been opened. Built of red stone in the Italian style of architecture, the school has eighteen classrooms and will accommodate 1,232 pupils. Special arrangements have been made for the teaching of music and cooking, and great attention has been paid to heating and ventilating. The classrooms are so arranged that by the opening of movable partitions they can be converted into two large central halls, one on the ground and the other on the upper floor.

## TENDERS.

## NEW CATALOGUE.

MESSRS. MESSENGER & CO., horticultural builders, Loughborough, are sending out their new catalogue, containing some excellent designs for winter garden conservatories, hot and greenhouses, from the unpretentious lean-to to the elaborate structure suitable for a Croesus. All the various appurtenances and adjuncts to horticultural building are shown, and all prices given in plain figures.

## TRADE NOTES.

MR. E. R. ARMFIELD, having an office at 787 Fulham Road, S.W., is open to receive commissions and samples of patents and other goods used in the building and decorating trades.

THE new sanatorium, Canterbury, now being erected from the plans and under the superintendence of Mr. A. H. Campbell, A.M.I.C.E., the borough engineer and city surveyor, is nearing completion. The contractors for the work are Messrs. G. H. Denne & Son, of Deal. The warming and ventilating is by means of Shorland's patent double-fronted Manchester stoves, with descending smoke-flues, patent Manchester grates, ornamental exhaust roof ventilators and special inlet panels.

MESSRS. G. M. RESTALL & SON, manufacturers of stained and polished quick-setting adamantine plaster, having found their offices at Gerard Street, Lozells, Birmingham, inadequate to the requirements of their increasing trade, have erected more convenient ones in proximity to their works at Soho Pool Wharf.

# ARMOURED DOORS

## A STEEL SHEATHED WOODEN DOOR WHICH IS FIREPROOF.

# BUILDING AND BUILDERS.

THE new block of barracks about to be erected on Wellington Lines, Aldershot, will cost 165,000*l*.

IT is proposed to enlarge Elmfield Primitive Methodist College at a cost of 2,000*l*.

NEW municipal buildings are to be erected at North Berwick on the site of the present building, in commemoration of Her Majesty's Diamond Jubilee.

THE congregation of the Bar Congregational church, Scarborough, have had plans prepared for a new church which they propose to erect this year in connection with the Queen's Diamond Jubilee.

A NEW Wesleyan Reform chapel is to be erected at Glossop in place of the Howard Street chapel, which, on account of its dangerous condition, is to be taken down. The estimated cost of the new building is 2,200*l*.

A SCHOOL for juniors is to be erected at Bromley Common, for the School Board, from the designs of Mr. Charles Bell, of 3 Salters' Hall Court. Mr. Bell is also the architect of the Christ's Almshouses now being built at Buckingham.

THE foundation-stone is to be laid on May 4 of a new church at Bryn-y-maen, in the parish of St. Paul's, Colwyn Bay, the cost of the edifice, together with a parsonage-house of 2,000*l*. value (including the site), and an endowment yielding at least 200*l*. per annum, being the gift of Mrs. Frost, of Min-y-don, Old Colwyn.

THE Board of Management of the Dewsbury Technical School have approved of plans submitted by Mr. J. L. Fox, the architect of the original buildings, for an addition to the

accommodation, which has been for some time inadequate. The school has 869 students, representing a class list of over 1,500, with 541 boys attending the elementary science classes. The proposal is to erect a wing of three storeys, having a frontage to Carlton Road. The cost is estimated at about 3,500*l*., and the Board of Management decided to recommend the execution of the work. It was also suggested that part of the money to be raised in the town for celebrating the Queen's Diamond Jubilee should be devoted towards the cost of building and furnishing the new wing.

A DECISION of considerable interest to builders in Glasgow has just been given by the Glasgow Dean of Guild Court. A petition was presented to the Court by the Procurator-Fiscal against Archibald Stewart & Co., builders, Glasgow, that they had failed to comply with a notice served upon them by the master of works to hinge or construct the windows of dwelling-houses in a tenement erected by them, in Garngad Avenue, so as to admit of the outsides of the windows being cleaned from the inside of the apartments. Messrs. Stewart objected that the by-law of the Glasgow Buildings Regulations Act, 1892, upon which the petition was founded, was *ultra vires* and incompetent. The decision of the Court is that the by-law is invalid so far as it requires "that in dwelling-houses all window sashes above the ground floor shall be hinged or constructed so as to admit of the outsides of the windows being cleaned from the inside of the apartment," finds that it was *ultra vires* of the Glasgow Police Commissioners to enact a by-law to this effect, and therefore finds that it is not necessary for the respondents to execute the work specified in the notice of the master of works.

# VARIETIES.

A NEW chapel in the Female Convict Prison at Aylesbury was on the 4th inst. consecrated by the Bishop of Reading.

UNDER the direction of Mr. Herbert Riches, of 3 Crooked Lane, King William Street, some extensive alterations are being carried out in Salisbury Lane, Limehouse.

A CO-OPERATIVE store, which has been erected in Field Lane, Batley, at a cost of 1,000*l*., and which forms the twelfth branch of the Batley Co-operative Society, was opened on the 6th inst.

No. 321.—The "KNIGHT" CARVED OAK ARM-CHAIR, £4 5s.

HEWETSONS, ARTISTIC FURNISHERS AND HIGH-CLASS DECORATORS, TOTTENHAM COURT ROAD, LONDON.

THE fourteenth annual dinner of the Sanitary Inspectors' Association took place on the 6th inst. at the Holborn Restaurant, under the presidency of Sir John Hutton, L.C.C., president of the Association.

The new St. Alban's Church at Vron, in the parish of Brymbo, near Wrexham, was dedicated on the 8th inst. The church has been erected on land given by the Vron Colliery Company, and the cost has been about 1,000*l.*, and there is seating accommodation for 240.

THE District Council of Walthamstow have appointed Mr. J. Williams Dunford, M.S.A., F.I.Inst., of 100c Queen Victoria Street, their architect for the public baths. Mr. Dunford's designs were placed first in a limited competition by the Council's assessor, Mr. Rowland Plumbe, F.R.I.B.A.

AN interesting ceremony took place at the Vatican on Monday, the 8th inst., when the restored Borgia apartments, composed of six magnificent rooms painted by Pinturicchio, were opened. The Pope and his court, the cardinals and the diplomatic body were present. The frescoes were white-washed over under Pius VI. at the end of the eighteenth century. The restoration both of the pictures and of the majolica pavement is considered a triumph of modern art.

A HANDSOME and costly reredos has just been placed in the lady chapel in the church of St. Michael's, Headingley, Leeds. It is a triptych, and the central panel represents the Resurrection, the two smaller panels the Blessed Virgin and St. Mary Magdalene on one side and St. Peter and St. John on the other. The base is ornamented with angels and emblems of the Passion. The reredos is a great addition to an already magnificent church, which is said to have cost about 24,000*l.*, inclusive of special gifts.

### ST. MARYLEBONE NEW BATHS AND WASHHOUSES.

THE Marylebone Road presented a festive appearance on Saturday afternoon last on the occasion of the visit of the Duke and Duchess of York to formally open the handsome and admirably-appointed new baths and washhouses which have arisen on the site of the old baths which were erected in 1848, when the surroundings were of a thoroughly rural description such as it is difficult to imagine at the present day.

The old establishment having been in work for nearly fifty years, and having become by constant use and hard wear too dilapidated for further restoration, was demolished. It is interesting to note that during the period mentioned 7,655,694 bathers visited the institution, the largest number in one week being 12,000, and the largest number in one day 3,429. The number of poor women who used the washhouses during the time was 1,281,295. The cost for water was 17,817*l.*, and the quantity consumed *one thousand millions of gallons.*

In 1895, as the result of a competition in which upwards of thirty leading architects took part, Mr. A. Saxon Snell, F.R.I.B.A., was appointed architect of the new buildings, which comprise 4 swimming and 101 warm baths, a public washhouse and laundry to accommodate 74 women, establishment laundry, boiler-house, engine-room, administrative offices, waiting-rooms and superintendent's apartments.

The first-class swimming-bath, which was erected from the designs and under the superintendence of the same architect more than twenty years ago, was found to be in such good condition that the Commissioners decided only to lengthen and re-decorate it, and add a gallery and other small improvements. It is a handsome and lofty hall, well lighted by a wide lantern the whole length of the roof, and is known as the Pompeian Bath. The recesses formed by the arcading of the sides contain 42 dressing-boxes, with galleries over, and large galleries at either end afford capital accommodation for witnessing sports and matches. This bath is 100 feet in length, 6 feet 6 inches in depth at one end and 4 feet at the other, and it holds 83,000 gallons. There are lavatories and shower baths in addition, and a spacious club-room at one end is specially adapted for the use of public school, regimental and other swimming clubs. In the winter the bath will be covered with a substantial flooring and converted into a public gymnasium. It is approached by a wide corridor from Marylebone Road, and has an entrance from Seymour Place.

The second-class bath has a water area of 170 feet 6 inches by 25 feet, and the third-class bath 66 feet by 25 feet, with a depth in each case of 6 feet 6 inches at one end and 3 feet 6 inches at the other. The walls of the baths are lined with white glazed tiles, relieved with coloured bands, and the bottoms paved with white and blue glazed bricks. The surrounding walls of both bath-rooms are faced with white glazed bricks and brown glazed brick dado. The footways round each bath are paved with bright red tiles. There are provided in the

## EWART'S COPPER "CROWN" VENTILATOR

WILL BE EXHIBITED AT THE

## BUILDING EXHIBITION

### AGRICULTURAL HALL,

MARCH 20-27, 1897,

OR MAY BE SEEN AT THE

## FACTORY—346, 348, 350 EUSTON RD., LONDON, N.W.

second-class bath 56 dressing-boxes and club-room, and in the third-class 50 boxes.

The ladies' swimming-bath has a water area of 60 feet by 25 feet, with a capacity of 44,000 gallons. It is 6 feet in depth at one end and 3 feet 6 inches at the other. The floor and walls are lined with white glazed tiles, relieved with faience tiles and coloured borders and bands. The footways are paved with ornamental coloured tiles, with a wide marble margin.

The warm baths, which are situated on the first floor, comprise 21 first-class and 48 second-class gentlemen's baths and 10 first-class and 19 second-class ladies' baths. The compartments are arranged in blocks divided by tile-paved corridors, and each bath is enclosed by enamelled slate divisions 7 feet high, and has an area of at least 40 square feet. The enamelled slate in the first-class baths is provided by Messrs. E. C. Braby & Co., and in the second-class by Messrs. E. Matthews & Co., and Bingley, Son & Folliot. Each compartment has an enamelled porcelain bath with American whitewood top and enamelled slate riser, and fitted with Busby's latest pattern full-way gun-metal valves and waste. The rooms generally are amply lighted and ventilated by large and lofty lanterns. Hot and cold douches and warm showers are also fitted to every first-class, and a large number of the second-class, baths.

The vapour bathrooms (of which two are arranged for gentlemen and one for ladies) are provided with a complete vapour bath, and a combined shower, needle, spray and sitz bath. The floors are paved with tiles, and the walls lined with glazed tiles.

The public washhouse and laundry are contained in one large area, 76 feet long by 64 feet wide, sub-divided by two partitions into a washhouse, and drying, ironing and mangling-rooms.

The washhouse is arranged with six rows of separate washing compartments, numbering 74 in all. Each compartment contains two wash-tubs, with hot and cold water and steam supplies and the necessary pails, scrubbing-boards, &c. Centrally situated are a set of four steam-driven centrifugal wringing machines, and the high rate of speed attained (1,200 revolutions per minute) insures effectual wringing of each load in three minutes. The drying-room is fitted with two large hot chambers and 74 separate drying-horses. They are heated by flues from two large coke furnaces in the basement, over which air is driven by means of a large blast fan. The ironing-room contains two steam-driven mangles, large ironing tables, two radial drying horses and two gas-heated ironing stoves. The

washhouse is lighted by a large lantern-roof, and the ironing-room by side windows, while special care has been taken as to the ventilation.

The boiler-house and engine-room are in the basement. The former is fitted with three large double-flued Galloway's patent boilers, each 30 feet long by 7 feet 6 inches in diameter, and having a capacity of 5,000 gallons of water. They are capable of working at a continuous pressure of 100 lbs. to the square inch, and are so connected that they can be used together or independently, either for steam generation or hot-water circulation. The engine-room contains two 12-horse power coupled engines, manufactured by Messrs. Marshall, of Gainsborough. Feed pumps of Picking & Hopkins's manufacture are provided in duplicate.

The whole of the hot and cold water, steam and waste pipes in the building are open to view, the large pipes having flanged joints for facility of examination or renewal. All the hot water and steam pipes are covered with asbestos. Storage is provided for 100 tons of fuel in close proximity to the boilers, and furnaces and a system of tram lines and turn-tables provides for a speedy distribution of the fuel.

A large tank containing 30,000 gallons of water is placed in the centre of the building, all parts of which are supplied therefrom. The swimming-baths, however, have separate connections to the water company's mains. Special attention has been given to the drainage, which is of the latest description; a separate deep-level iron drain is provided from all the swimming baths. The administrative block, which faces the Marylebone Road, is three storeys in height above the basement, and contains on the ground-floor a double entrance for gentlemen in the centre, a separate entrance for ladies and a private entrance. Between the entrances are two handsome and commodious waiting-halls, "first-class gentlemen's" and "first-class ladies" respectively. The main entrance leads into a lofty hall, with a central pay-office, giving access to all the gentlemen's swimming and warm baths.

The first floor contains the board room and superintendent's office, and the top floor the private apartments. The whole of the building has been designed with the special view of easy and economical supervision and ready access to all parts, and is furnished with electrical and telephonic communication from every department to the chief office.

The lighting throughout is by electricity, supplied through meters from the mains of the Metropolitan Supply Company.

In the architectural features and general finishing of the

READING CASES for THE ARCHITECT.  
Price 2s.—Office: 175 Strand, London, W.C.

building, no less than in its substantial construction, the building is worthy of the parish of St. Marylebone. The front of the building is faced with Portland stone up to the first floor level, and above that with red bricks relieved with Portland stone dressings. The forecourt is paved with bright tile footways, and is surrounded with red brick and stone walls and piers. The railings and gate in front and dividing the entrances are of wrought iron. The lamps on the piers are constructed with wrought-iron scrolls and copper frames, glazed with bevelled plate-glass, made to the architect's designs.

The screen and central pay office in the entrance hall are constructed in polished mahogany. The mosaic floor was laid by Messrs. Minton & Co., of 50 Conduit Street, Regent Street, W., who also executed the whole of the tile pavings and wall linings, including the swimming-baths and the hand-painted panels, and of the first-class (Pompeian) bath.

The painting of the large iron water tank, the boilers, the walls and divisions of the washing-boxes, the fronts and runners of the drying-horses and the fronts of the dressing-boxes in the Pompeian bath has been executed by Messrs. Rhus & Co., Limited, of 149 Fenchurch Street, and High Wycombe, with their patent Japanese lacquer, for which it is claimed that it withstands the weather and atmospheric influences four times as long as any ordinary paint, which is a great desideratum where work is situated in places difficult of access, such, for instance, as the great tank in question. It is also impervious to the effects of heat or acids, and as a matter of fact, in the washing-boxes, where it has been subjected to the constant splashing of soap and soda since the informal opening of the washhouses some three months since, is as fresh as when first applied. For interior work, in addition to its inherent gloss, which is a high one, it is susceptible of hand-polishing, which gives it all the brilliancy which is found in goods of Japanese manufacture.

The entire cost of the building is 50,000/. The contractor for its erection is Mr. Charles Wall, of Chelsea. The engineering work has been executed by Messrs. J. & F. May, and the electrical works by Mr. L. Alwyn. The whole has been carefully supervised by Mr. F. W. Lee, the clerk of works. Quantities and measurements by Messrs. Northcroft, Son & Neighbour.

All the swimming baths are emptied every night during the summer months and refilled in the early morning, about 250,000 gallons of water passing from the baths daily, to the benefit of the sewers in the vicinity.

### ALHAMBRA THEATRE.

A LARGE and appreciative company was invited by the directors of the Alhambra on Tuesday afternoon to inspect their new entrance in Charing Cross Road. The old entrance to the best parts of the house left much to desire, both as regards appearance and convenience, but the new one, which was first thrown open to the public on Wednesday evening, is a superb piece of Moorish work, correct in design and admirable in colour, and should alone be sufficient to attract all lovers of the beautiful.

The circular vestibule panellings have been treated with Pavonazza, Devonshire and other marbles, and the slender columns in Sicilian, the whole treated in florid Turkish and Cairene styles, the ceiling decorations being identical with a treatment of one of the saloons in the Viceroy's Palace at Cairo. The newels and banisters to staircases have been especially designed by the architect in the same character.

The fibrous plaster friezes, reliefs and panellings have been specially modelled from originals in the Alcazar and Alhambra palaces of Seville and Granada. On either side of the arches are stalactite pendentives adapted from Moorish designs. A handsome shelter has been erected in front of the new vestibule entrance, the columns and caps of which have been adapted from the Hall of Justice in the famous Alhambra, Granada, reproduced by Messrs. Hart, Son & Peard, of Drury Lane. The doors of the grand entrance, including corridor, vestibule, scene dock and residence, are reproductions of an old Moorish carved work. The walls of the grand entrance corridor have been treated in exceptional richness, and the handsome tiles which have been adopted in great variety are identical with those at present being used for the renovation of the Alhambra and Alcazar Spanish palaces, and were specially selected by Mr. Alfred Moul during a visit to Spain in the early part of last year. The tiles are the manufacture of the famous Spanish artist potter, Mensaque, entrusted by the Spanish Government with the renovations of their historic and magnificent palaces.

The treatment of the new subway constructed for the convenience of the public for passage from the corridor to the north side of the auditorium for all reserved stalls and private boxes, is especially striking, the bold relief in fibrous plasters being an exact copy of one of the finest friezes of the Granada Alhambra. The whole of the decoration of the subway is a faithful reproduction of sections of the Granada Alhambra decoration. The effect of all this beautiful work,

# MAW & CO. LIMITED

**Messrs. W. B. SIMPSON & SONS, 99 St. Martin's Lane, W.C.**

when illuminated by electric light, is brilliant in the extreme, and at the same time exceptionally refined and elegant.

The entire work has been designed and its execution superintended by the Alhambra Company's architect, Mr. W. M. Bruton, of Trafalgar House, Green Street, Trafalgar Square, the contractor being Mr. H. L. Holloway, of Deptford (Mr. Weymouth, chief foreman); the decorations of the vestibule and corridor by Messrs. S. & S. Dunn, of Brewer Street (Mr. Walters, chief foreman); the special stencilling and decorations of subway by Mr. Watson, of Kingston; electric lighting by Messrs. F. W. Henton & Co., and the heating by Messrs. Berry & Co.

The directors took the opportunity to introduce their latest "find" in the person of Signor Leopoldi Fregoli, whose entertainment should draw all London for a long time to come. He possesses all the essentials of a first-class draw, being comely, young, and artistically as well as mechanically clever, and the possessor of a fine voice, his entertainment is a revelation to the present generation at least. The feature of his "show" is the marvellous rapidity with which he changes his dress and appearance. His repertoire, too, is of the most extensive description. The pieces he selected on Tuesday afternoon were "The Impossible Duet," in which he represents a male and a female character; "The Singing Lesson," in which he is at once the professor and the pupil; "Relampago," in which he impersonates seven characters, and "The Medallion," in which he appears in no less than fifteen parts, sings, dances, &c., making his changes with a rapidity which is simply incredible. With the combined attractions of the new entrance and Fregoli the Alhambra shareholders should be in for a "good time."

### THE ELECTRIC CURRENT.

In his lecture at Carpenters' Hall on the 3rd inst., Professor J. A. Fleming, D.Sc., gave an outline of the development of electricity during the present century. Volta in 1800 presented his discovery rather as a curiosity than as anything likely to be the first step in a wonderful series of discoveries and inventions which has produced such marvellous results. In every large town the electric current is being conducted like water or gas by means of copper bands, finding employment for thousands of workers and for millions of capital, and, in addition, crosses in every direction, not only the land, but the great ocean beds, just as the nerve fibres bind the living body.

Experiments demonstrating the various effects produced by two metals in the voltaic cell, the evolution of heat, the induction of magnetic influence and the deflection of a magnetic needle coming within the field of this influence, which forms the basis of all telegraphic work, were effectively made. An electric current passing along a wire deflects a magnetic needle at right angles to its normal position; if the current is reversed the needle is deflected in the opposite direction. Just as in flag signalling, the waving of a flag to left or right a varying number of times is made to form an alphabet, so by a series of long and short deflections, technically the "dot and dash" system, the telegraphic alphabet is formed, and is read by the skilled operator with all the ease that a musician reads music. For the purpose of ocean telegraphy very delicate signalling apparatus was necessary. Sir W. Thomson invented a "mirror galvanometer," in which a very light mirror delicately poised is arranged to reflect the rays of a lamp on to a scale in such a way that the movement of a spot of light indicates the slightest movement of the mirror and the extent of each movement. This has been to a great extent superseded by the "syphon recorder" of the same inventor. Attached to a sensitive galvanometer by a silk fibre is suspended a fine syphon of glass, one end of which dips into an ink vessel, and the other records on a roll of paper, moving automatically, the deflections of the needle. A magnified copy of a message recorded in this way, with the series of long and short waves, drew forth the comment that it was not worse than the handwriting of many people.

Demonstrations of the electrolytic action of the electric current were also given, the decomposition of water and of chemical salts, and the electro deposition of metals, as used in electro-plating or in forming meters for measuring the amount of current passing. Investigation showed that the magnetic influence flowed round a wire while current was passing in a series of circular waves, which, first known as the magnetic circle, is now generally styled the magnetic field. The production of electro-magnets—that is, the magnetisation of metal by means of electricity—was found to be best effected by means of a spiral wire passing round the bar of metal. At first the spiral wire only enclosed the bar once, but Professor Joseph Henry, in America, by covering wire with silk, produced much stronger results by passing the wire so insulated a great number of times round the metal. In the case of steel very powerful magnets were obtained, but soft iron only remains magnetic while the current continues to flow.

The next great step was the discovery by Faraday on August 31, 1831, that a current can be produced in a closed circuit by moving a magnet near it. This discovery of the generation of electricity by magnets and motion is really the germ of the dynamo. If a magnet be rapidly thrust into the hollow of a coil of insulated wire a slight flow of current is produced, and easily made evident if the wire is connected to a galvanometer. Reversing the action—that is, slipping the coil over the magnet—produces the same effect. By taking a U-shaped magnet, and causing a copper disc to revolve rapidly between the arms or poles of the magnet, an induced current is produced, which can be collected by a spring pressing against the edge of the disc, the spring becoming the forerunner of the “brush” of the finished dynamo of to-day.

Some local authorities who are conducting their own electrical supply are in a flourishing condition, notably Edinburgh and Brighton, where the profits are being utilised in reducing the rates. Energy is uncreateable; the dynamo is only a transformer of energy. At Niagara, after employing 1,000 men for three years in tunnelling the rock, we have turbines conveying power to the house 150 feet above, where dynamos, on same principle as that of Faraday's, collect and transform the power of Niagara into electrical energy, and transmit it for use at Buffalo, eighteen miles away. The amount of water taken is so small as to have made no apparent diminution; it may rather prolong the life of the falls by lessening the amount of erosion. At Rome the engineers have taken the water from the falls of Tivoli without diminishing their æsthetic value. The water is led to the turbines by hydraulic fall pipes 6 feet in diameter, which are connected to dynamos in the powerhouse developing over 2,000 horse-power. The water is then returned to the lower fall, which is not in any way affected. Nine miles across the Campagna, and nine miles from Rome, is an observation half-way house; and just outside Rome is the transforming station, where it is lowered down to be distributed throughout Rome.

Electro-metallurgy and electro-chemistry are not receiving the encouragement or appreciation they deserve from our manufacturers. Extensive businesses are carried on without a single specialist or scientific man on the staff, where in a similar establishment in Germany we should find not one but several.

The Right Hon. Lord Reay, who presided, in proposing a vote of thanks to Dr. Fleming, mentioned a case that came under his notice while he was Governor of Bombay. A gentle-

man proposed to establish at his own cost technical schools, not from any philanthropic motives, but in order to use India to create a market for a material which he was manufacturing cheaply in Germany. The dependence of trade upon applied science is very great, and every effort should be made by Government and public to facilitate the labours of those who devote themselves to scientific research.

The vote of thanks was cordially carried, as was also a vote of thanks to the chairman, Lord Reay, which was moved by Professor Banister Fletcher.

### ADMIRALTY CONTRACTS.

ACCORDING to the statement presented to the House of Commons by the First Lord of the Admiralty, the new electric shop at Portsmouth will be completed during the year. Work on the two new jetties is nearly finished, and the new boiler shop has been commenced. At Devonport, the enlargement of No. 2 dock and the extension of No. 1 jetty with foundations for 100-ton shears have been begun.

On the “Admiralty Mole” extension, Gibraltar, a length of 860 feet has been brought up to low-water level, and 116 feet more to 10 feet below low-water level. The rubble mound forming the base of the detached mole is in progress, and about 206,000 tons of stone have been deposited on the site. Two dredgers are at work deepening the harbour.

The railways and incline at Portland from the quarry have been relaid, and the new shipping jetty is completed. The construction of the new breakwater between the dolphins has been begun.

The survey and plans have been completed of Dover harbour, and are now under consideration by an inter-departmental committee, composed of representatives of the Admiralty, the War Office and the Board of Trade.

The work provided for under the loan at Chatham has been completed.

At Portsmouth the dredging of the bar is finished. The rest of the work is being proceeded with.

Good progress has been made at Devonport.

The contractor for the Keyham Dockyard extension is making satisfactory progress.

The two new Portsmouth docks have been completed and are in use. The railways and approaches will be finished as soon as the ground has sufficiently consolidated.

## TO PREVENT CISTERNS AND PIPES FREEZING.

Illustrated Catalogues on application.

The site of the new Gibraltar dockyard extension is being embanked and reclaimed. The excavation of the New Mole Parade is practically finished. The lengths of the docks are finally settled are:—No. 1 (double) dock, 850 feet; No. 2 dock, 550 feet; No. 3 dock, 450 feet. Owing to the length of time occupied in communicating with such a distant station as Hong Kong and to the necessary negotiations with other departments, it has not been found possible to commence the dockyard extension as yet, but it is hoped that plans will be shortly settled and the work will then be put in hand without delay.

The necessary land has been acquired for the Chatham Naval Barracks. The reconstruction of the Brennan Torpedo Factory, which occupies part of the site, is proceeding, and the new buildings will be begun early in the summer. The War Office are arranging for the transfer of the Anglesea Barracks at Portsmouth at an early date. Plans for the new naval barracks are under consideration.

The plans have been approved of Keyham Naval Barracks and tenders will shortly be invited.

Considerable difficulty was experienced in finding a suitable site for the Chatham Naval Hospital not too far removed from the naval establishments, but land has now been acquired, and plans for the hospital are being prepared.

The new buildings of the Walmer Marine Dépôt have been completed and handed over for occupation.

The new wing of Keyham Engineer Students' College will be completed about April next.

Much time was spent in an endeavour to arrange terms of purchase for the site selected for Dartmouth College by friendly negotiation with the representatives of the owners of the land, but unfortunately without success. Steps have now been taken to acquire the land under the provisions of the Naval Works Act of 1895.

The North Gorge Magazine at Gibraltar is nearly completed, and the new magazine at Corradino (Malta) is more than half finished.

Provision will be made in a Bill to be submitted to Parliament for the continuation of the unfinished works contained in the schedule of the Naval Works Act, 1896, and for certain new works which Parliament will be asked to sanction. The Bill will also include provision for the completion of the improvements to the dockyards at Pembroke and Haulbowline, which are already in progress.

## PROPOSED BY-LAWS ON HOUSE DRAINAGE.\*

(Concluded from last week.)

**By-law 5** prohibits right-angled junctions, and requires that a branch drain shall join another drain obliquely in the direction of the flow of such drain.

If the words "and as near as practicable to the invert thereof" were added, it would prohibit a branch drain being joined to another at or near the top of the drain, and the risk of solid matter being deposited on the invert or splashed on the sides of a drain would be avoided.

It is desirable, also, that the use of double Y junctions should be prohibited, on account of the tendency of a portion of the liquid and solid matter discharged by the branch drains to be washed up one or other of the branches, or up that part of the main drain immediately above the junction of the two branch drains.

**By-law 6** requires that the drains shall be ventilated in the manner generally adopted, viz. by two untrapped openings to the drain. One of the openings is to be near the surface of the ground and is to communicate with the drains by means of a suitable pipe, shaft or chamber; the other is to be obtained by carrying-up from a point in the drains, as far distant as practicable from the first opening, a pipe or shaft vertically to such a height and in such a position as to afford a safe outlet for foul air. The sectional area of every ventilating pipe or shaft is to be not less than that of the drain with which it communicates.

A soil pipe or the waste pipe from a slop sink may be used as the pipe or shaft which this by-law requires to be carried up from the drains provided its situation, sectional area, height and mode of construction are in accordance with the requirements applicable to the pipe or shaft to be carried up from the drains. Any such soil pipe or waste pipe which has an internal diameter of not less than 3½ inches, and which complies in all other respects with the requirements of the by-law as to the pipe or shaft to be provided for the ventilation of any drain shall be deemed to provide adequate ventilation for any drain having an internal diameter of not more than 4 inches.

It appears unnecessary to require, that where a person chooses to have a 6-inch drain to a house he should be

required to fix ventilating pipes 6 inches in diameter, as one of 4 inches diameter would be sufficiently large to ventilate the drain.

In all cases it is prudent to place the ventilating opening which is to be near the level of the ground as far as practicable from any door, window or other opening to a building, as such ventilating openings, although commonly regarded as "fresh air inlets," are found to act at times as outlets for foul air. The proposed by-law does not recognise this, but it might be safer to make the necessary addition, which would direct attention to the matter, as the ventilating openings referred to are often placed near windows or doors, and though provided with valves for the purpose of preventing the outlet of foul air, the valves become defective, or are prevented from closing by the accumulation of dust or other substances which are blown into them.

It is the author's practice not to require the ventilating opening near the surface of the ground to be provided at a building where the drains can be satisfactorily ventilated by means of two soil pipes carried above the roof, and he considers that the by-laws should be altered in order to allow a similar practice and also to permit both the ventilating openings which the by-law requires to be provided to be furnished by pipes carried to such a height as will provide a safe outlet for foul air.

The material of which ventilating pipes are to be made is not specified. The by-law should contain provisions similar to those in by-law 8, and the suggested additions thereto relating to soil pipes and ventilating pipes.

The by-law should prohibit the connection of a rain-water pipe or a waste pipe from a lavatory, bath or sink, except a slop sink, to a ventilating pipe.

**By-law 7** is directed against the fixing of gullies inside a building in such a manner as to be connected to a drain communicating with a sewer.

There are cases in which this arrangement cannot be avoided, and it is, therefore, desirable that it should be allowed, subject to the sanction of the local authority.

The by-law further provides for the trapping of waste pipes from baths, lavatories and sinks. The traps are to be ventilated into the open air whenever necessary for the preservation of the seal of such traps. The waste pipes are to be taken through an external wall, and are to discharge in the open air over a trapped gully or into such a gully above the level of the water in the trap.

Waste pipes from baths or lavatories should, with the

consent of the local authority, be allowed to discharge into the open heads of rain-water pipes as stated in connection with by-law 2.

The material of which waste pipes and traps are to be formed is not mentioned, nor is the method of jointing them specified. The author has seen houses in which waste pipes have been formed of zinc, the joints being made by pushing the end of one length of pipe into that of the adjoining length and smearing the junction with putty. Those whose ideas of sanitary work are so low will readily take advantage of the proposed by-law and provide waste pipes of a similar description unless the by-law is amended, and the material of which waste pipes and traps shall be formed is specified. The only materials which should be allowed for such pipes and traps are drawn lead, galvanised wrought-iron, stoneware or material equally suitable, and the joints should be respectively wiped soldered joints, screwed sockets or Portland cement. Another necessary addition to the by-laws is a provision that the traps referred to shall be provided with movable caps for the inspection and cleansing of the traps. The necessity for prescribing that waste pipes shall discharge over gullies or into gullies above the level of the water in the traps will be appreciated by those who have seen, as the author has, waste pipes discharging into eaves gutters and even upon zinc flats and roofs, which have thereby been covered with grease and filthy refuse, the smell from which has been most offensive and injurious to the occupants of the houses.

The by-law also requires that the overflow pipes from cisterns and from safes under baths or w.c.'s shall discharge into the open air.

The overflow pipes from lavatories or baths should be required to discharge into the waste pipes on that side of the trap which is nearer to the lavatory or bath. This provision has been omitted from the proposed by-law.

**By-law 8** relates to soil pipes and the materials of which they are to be formed, also to the method of connecting traps thereto and of connecting soil pipes and waste pipes to drains.

At new buildings soil pipes are required to be placed outside wherever practicable; a proviso not contained in the existing by-law of the Council, which requires that soil pipes to such buildings shall in all cases be placed outside. The proposed by-law, by requiring that soil pipes outside buildings shall be formed either of drawn lead or cast-iron, will prevent the use of zinc or stoneware for such soil pipes, such materials being allowed under the existing by-law in consequence of the Council

**P. A. GILBERT WOOD,**  
175 STRAND, LONDON, W.C.

**VOLUME LVI. OF THE ARCHITECT.**  
Handsomely bound in Cloth, Gilt Lettered.  
Price 12s. 6d.

Office: 175 Strand, London, W.C.

having omitted to prescribe the material of which outside soil pipes shall be formed.

No soil pipe is to be less than  $3\frac{1}{2}$  inches diameter. The weights of lead and of iron soil pipes are specified, the former being equal in thickness to 8 lbs. lead. Cast-iron soil pipes  $3\frac{1}{2}$  inches and 4 inches diameter are to be not less than  $\frac{1}{4}$  inch thick, 5 inch and 6 inch must be not less than  $\frac{1}{8}$  inch thick. The sockets of cast-iron pipes must in no case be less than  $\frac{1}{8}$  inch thick.

It is important that cast-iron soil pipes should have a smooth interior, and that they should be protected from corrosion; and ventilating pipes through which no water is discharged need to be specially protected internally from corrosion, otherwise the bends connecting them to the drains become stopped by rust and the ventilation of the drains impeded. The by-law should therefore require that all cast-iron soil pipes and ventilating pipes shall be either galvanised or coated inside with Dr. Angus Smith's composition.

It is perhaps the experience of most engineers who have to deal with house drainage that a cast-iron soil or ventilating pipe perfectly constructed is difficult to obtain. Usually the spigot ends are ragged and weak, the bottoms of the sockets badly formed and sloped so that the spigots get little or no bearing upon them, and the width of the sockets insufficient, so that when the molten lead is run in it seldom fills the sockets, but forms a shallow band round the upper part only. With such pipes firm and sound work is impossible, and it appears to be necessary that the by-law should specify that cast-iron pipes used for soil or ventilating pipes shall be made with the spigot ends beaded, with the bottom part of the sockets at right angles to the axis of the pipes, and that the annular space for the lead with which the pipes are to be jointed should not be less than  $\frac{1}{8}$  inch wide.

The method of connecting lead or iron soil pipes with the traps of w.c.s and with drains is the same as the County Council's by-laws at present in force.

Whilst the subject of the connection of soil pipes and waste pipes to drains is dealt with in detail in the by-law, it might be still further extended so as to describe the construction of the pipe forming the connection between the soil or waste pipe and the drain. This usually consists of an ordinary bend which, unless encased in a block of concrete, is liable to slip, and the movement would destroy the joints at its upper and lower ends. Better and sounder work would result by the use of a bend with a flat foot or base attached.

In all cases where a "wiped or overcast joint" is referred to

the word "metallic" should be inserted, so that the by-law may read "wiped or overcast metallic joint."

The proposed by-law differs from that at present in force, by requiring that the open end of a soil pipe shall be carried to such a height as to afford a safe outlet for foul air, instead of to a point above the highest part of the roof of the building to which it is attached. An important omission from the by-law is the requirement that a wire guard should be provided for the protection of the open end of every soil pipe.

**By-law 9** provides for the ventilation of the traps of water-closets in order to prevent their being syphoned by the discharge from other water-closets connected with the same soil pipe. The ventilating pipe, provided for this purpose is to be formed of drawn lead, and with wiped joints if inside a building.

This pipe should in all cases be formed of drawn lead, and if it has an open end, a wire guard should be provided for its protection. The word "metallic" should be inserted between the words "wiped" and "joint."

**By-law 10** relates to the construction of slop sinks and the traps and waste pipes connected therewith.

Similar provisions to those referred to in connection with cast-iron soil pipes under by-law 8 should be added to this by-law with respect to cast-iron waste pipes. A wire guard should be specified for the open end of every waste pipe.

**By-law 11** requires that the pipes, drains, traps and apparatus connected therewith at any building shall be maintained in a proper state of repair by the owner of such building.

**By-law 12** provides that any person offending against any of the foregoing by-laws shall be liable to a penalty of 2*l.* for every such offence, and in the case of a continuing offence to a further penalty of 20*s.* for each day after written notice of the offence from the vestry.

The last, **By-law 13**, is as follows:—"These by-laws shall, so far as practicable, apply to any person who shall construct any pipe or drain or other means of communication with sewers, or any trap or apparatus connected therewith so far as he shall effect any such works in any buildings erected before the confirmation of these by-laws, as if the same were being constructed in a building newly erected."

From this by-law it would appear that the by-laws will, as mentioned at the commencement of the paper, apply primarily to work at new buildings, and in the case of existing buildings only to new work thereat, and that the local authority will have no power to require that the repair or reconstruction of drains shall be carried out in accordance therewith. Section 202 of

## S. B. BOLAS & CO.,

MEDALLISTS, ROYAL PHOTOGRAPHIC SOCIETY,

Architectural Photographers & Collotype Printers,

11 LUDGATE HILL AND 3 CREED LANE, E.C.

PRICE LIST AND ESTIMATES ON APPLICATION:

the Metropolis Management Act, 1855, under which the proposed by-laws are being made, does not limit the power of the Council to the making of by-laws for the purposes of regulating the construction of drains, &c., but included the "repairing of pipes, drains, &c." in the list of matters respecting which by-laws may be made.

It is, of course, important that the repair or reconstruction of drains, &c., at existing buildings should be properly carried out, especially as the necessity for the work generally arises from nuisance and illness caused by the defective condition of the drains and sanitary arrangements. Frequently the owner of the building, after the receipt of a notice from the local authority requiring the abatement of a nuisance, will have as little work carried out as possible, and where the whole of the drains need reconstructing to improved lines and levels he will do no more than relay them on the existing lines, and will then defy the local authority to compel him to do more so long as the nuisance is abated. Having regard to such cases, it seems desirable that the words "or repair" should be inserted after "construct" in the by-law if the Council is advised that it would not be contrary to the section under which the by-laws are made.

The following is a list of matters not dealt with in the proposed by-laws, and the necessity for by-laws relating to them will probably be self-evident.

1. The submission to the local authority of plans and sections of proposed drainage works.

2. The scales to which the plans and sections are to be drawn, and the particulars which are to be shown thereon.

3. Work not to be commenced until plans, &c., have been approved by local authority. Manner in which such approval is to be given.

4. Work to be carried out in accordance with approved plans, &c.

5. Time for completion of work

6. Work not to be covered until inspected and approved.

7. Notice to be given when work is completed and ready for inspection and testing.

8. Persons responsible for execution of work to fill drains with water in order that they may be tested by officials of local authority.

9. Work covered before being inspected and approved to be uncovered within forty-eight hours after notice so to do.

10. Time to be fixed during which work found contrary to by-laws is to be constructed so as to comply therewith.

11. Thickness of material for drains 9-inch and 12-inch diameter.

12. Materials of which gullies are to be made. Covers to gullies. Method of fixing gullies.

13. Surfaces adjoining gullies to be formed so as to prevent overflow of liquid discharged on grating, and to be paved with impervious paving where necessary.

14. The construction of urinals, and the traps, pipes and flushing arrangements connected therewith.

## PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

### APPLICATIONS FOR PATENTS.

4681. William Henry Prestwich, for "An improved door-spring."

4719. John Baxter Corrie, for "Improvements in pipe joints."

4740. John Cryer, for "Improvements in flushing apparatus for waste or slop water-closets."

4745. James Zeare, for "Improvements in ventilators."

4797. David Younger Annan, for "Improvements in and relating to windows and their frames."

4838. George Louis Vogel, for "Improvements in shutter-fasteners."

4854. Fritz Eisenbeis, for "Improvements in ventilators."

4909. Henry William Stones and Frederick Higgs, for "Improved construction of lock-up houses or sheds for cycles."

4913. Thomas Henry Sullivan, for "Improvements in ladders."

4920. Basil Edgar Bailly, for "Improvements in tiles for kiln floors."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 73 Chancery Lane, London, W.C.

# THE NEW EXPANDED METAL

Meshes from  $\frac{1}{8}$ th in. to 6 in. wide. Strands from 24 B.W.G. to  $\frac{1}{8}$ th in. thickness of steel.

**FOR BUILDING CONSTRUCTION**, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

**FOR SOLID PLASTER PARTITIONS**, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

**FOR FIREPROOF LATHING**, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

**FOR CONCRETE FLOORS WITH EXPANDED METAL**.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

**FOR EXTERIOR WALLS OF BUILDINGS**.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

**FOR FENCING, TREE GUARDS, WINDOW GUARDS**, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

**ORNAMENTAL. STRONG. CHEAP.**

**OTHER USES FOR EXPANDED METAL**.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archedways. Is highly ornamental and exceedingly durable, having no joints to rust away.

Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

**BRASS, ALUMINIUM**, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

**CATALOGUES AND PRICE LISTS** can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

**THE EXPANDED METAL COMPANY, LTD.,**

For constructing 633 yards of main sewer of 12-inch and 9-inch pipes in Mellish Road, with manholes, ventilators, &c., for the Corporation.

H. HOLLOWAY, Wolverhampton (accepted) £328 6 0

## TRADE NOTES.

FOR the ventilation of St. Paul's Street Schools, Aberdeen (Messrs. D. & J. R. M'Millan, architects, Aberdeen), Messrs. Cousland & Mackay's "Climax" patent direct-acting turret ventilators have been used and supplied from their works at Glasgow.

THE Wheatley Schools are being warmed and ventilated throughout by means of Shorland's patent Manchester grates, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

ON the 16th inst. the Tottenham District Council sought an injunction to restrain Messrs. Williamson & Sons, Limited, brickmakers and dust contractors at Tottenham, from using brickfields of which they are occupiers in such a way as to create a nuisance. After witnesses to the nuisance gave evidence the jury intimated that they did not want to hear any more evidence of that kind. The managing director of the defendant company denied that there was any nuisance caused by them. The jury sent a communication to Mr. Justice Hawkins saying they considered there was no evidence of an actionable nuisance. Counsel for the District Council said the case would go to the Court of Appeal. Judgment was entered for the defendants.

## THE BUILDING TRADES EXHIBITION AT THE AGRICULTURAL HALL.

THE long line of annual exhibitions devoted to the interests of the building trades having been interrupted last year, the show this year bears unmistakeable signs of benefit derived from the rest, and the old *locale*, the Royal Agricultural Hall at Islington, is packed from floor to ceiling with exhibits, which are for the most part excellent of their kind, and the greatest taste has been exercised in their advantageous display. The Lord Mayor and Sheriffs will formally open the exhibition to-morrow (Saturday) at noon, and the Architectural Association will visit it at three o'clock the same day. There will be handicraft competitions every evening. Next week visits will be paid by the Association of Municipal and County Engineers, the Institute of Clayworkers, and the Builders' Merchants' Association of London. On the 24th inst. a conference of painters and decorators will take place at the hall, and on the following Saturday the craftsmen will receive their prizes at the hands of Sir Arthur Arnold. Altogether this year's exhibition promises to be the most successful and attractive that has been held for many years. We shall, as usual, give full descriptive accounts of the various exhibits which, commencing in this, will be continued in the next and following issues.

*Mural Decorations Company.*

Amongst the many interesting exhibits, that of the Mural Decorations Company, at Stand 63C, in the Central Avenue, deserves notice. Here are to be seen specimens of ceilings, panels, mouldings, cornices, centreflowers and other plaster goods of exceptionally bold relief and great elegance of design. The method of fixing, and the easy way in which the surface of these goods can be stippled, coloured, silvered or gilded, will be explained by expert attendants at the stand. Photographs and drawings of special work executed by this firm at theatres, music halls, mansions, &c., both in this and other countries, will also be shown. The manufactures of the company have been referred to in these columns before now, and architects and builders will find a visit to this stand well repaid.

*H. Hermann, Limited.*

Messrs. Hermann have again brought the picturesque pavilion which proved such an attractive feature at the last Builders' Exhibition, and again it is fitted up with specimens of their now well-known machine-carved panels, pilasters, capitals,

piano fronts, &c. All this work is carefully and artistically finished by hand, and is equal to the best class of handwork,

from which it is indistinguishable. Messrs. Hermann are now producing carved mouldings up to 14 feet long, at a price very much lower than that hitherto paid for these goods, and have

lately executed three beautifully carved screens, which have been greatly admired. They have in hand some important contracts with the leading railway companies and piano manufacturers, for whom their productions are singularly suitable. The panels shown above give an idea of the firm's designs, but do not convey any impression of the sharpness and admirable finish of the work.

*Blackman Ventilating Company, Limited.*

The Blackman Ventilating Company are showing a 30-inch Blackman fan, electrically driven by a continuous current motor fixed on the spindle of the fan—this is of the usual Blackman type, driven by 100-volt current at about 600 revolutions, as used for the ventilation of buildings, billiard-rooms, smoke-rooms, kitchens, dining-rooms, &c.—a 48-inch Blackman fan of usual type, not driven, and a Blackman type air-warmer for steam, containing forty tubes, each 7 feet long by 4 inches diameter. Attached to this is one 30-inch Blackman fan (belt driven) forcing air through the heater or through a cold air by-pass, so that the air may be delivered into the buildings or drying-rooms for ventilating or drying purposes at any requisite temperature. The quantity of air passing through the heater or by-pass is controlled by a simple valve.

*The Expanded Metal Company, Limited.*

This company, which has again taken possession of the central position in the Hall, make a brave show of the various uses to which their expanded metal can be applied. Since the last exhibition the business of the Company has made important strides alike in the output, the application and the metal used for their specialty, and they are now showing samples in steel, brass, copper, aluminium, &c., also specimens of fencing, hurdles, tree-guards, &c., of various descriptions, and samples showing the application of the metal for concrete floors, suspended ceilings, solid partitions, encasing ironwork, pillars, &c.

*Peters, Bartsch & Co.*

This firm is showing at Stand 58, Row B, samples treated with their *Carbolineum Avenarius*, which is extensively used by leading railway companies, estate agents and contractors, and always with exceptionally satisfactory results. Its great merit consists in its penetrating the wood by its own action, without any pressure. It therefore does not require any

# EWART'S COPPER "CROWN" VENTILATOR

WILL BE EXHIBITED AT THE

## BUILDING EXHIBITION AGRICULTURAL HALL,

MARCH 20-27, 1897,

OR MAY BE SEEN AT THE

## FACTORY—346, 348, 350 EUSTON RD., LONDON, N.W.

machinery for its application, as creosote does, and it does not clog the pores of the wood, and thereby engender dry rot, as tar and other similar materials frequently do. It imparts to the wood a nice nut-brown colour, which is still further improved by the application of Antioxide, another production of the firm, which, in addition to the purpose just referred to, effectually protects iron and other metals from rust and oxidation. It is absolutely non-poisonous, and effectually resists steam, noxious gases and salt water. It combines well with metal, sets hard, and gives to bright and polished surfaces a burnished appearance, thus doing away with the trouble of continued cleaning. It is suitable for all iron structures, bridges, piers, &c., all kinds of machinery, maritime, stationary and locomotive engines, agricultural machinery and implements, and all articles which require permanent protection from rust and oxidation. It is also particularly recommended as a protection from the action of sea water. Several of the railway companies now coat their signal-boxes with Carbolineum and afterwards with Antioxide, which gives them a beautiful mahogany-like appearance.

The indestructible combination washers which are also shown consist of rings of soft metal, grooved outside, and holding in the groove packing material, such as asbestos, rubber, hemp, &c. The soft metal, in conjunction with the packing included, will accommodate itself readily to any unevenness in unplanned flanges. The rings give a metallic and indestructible protection to the packing material against any injurious action or pressure of steam, heat, &c., from the inside of the pipe. Owing to their construction, the washers resist the highest pressures, cannot blow out, and must therefore recommend themselves to all users on account of their efficiency and extraordinary durability and safety. With these washers no difficulty will be experienced in opening a joint, as is very often the case with other packing materials, and the flanges of joints made with the indestructible combination washers will be found on opening to be perfectly clean.

Carbolineum is a splendid material for the treatment of wood-paving blocks, and the firm have during last season carbolised all the blocks for Northumberland Avenue, Whitehall and other thoroughfares.

*Shanks & Co.*

Messrs. Shanks & Co. have in Bay 1 a really imposing display of their well-known sanitary appliances, the more noteworthy among which are their "Fin de Siècle," "Independent," "Modern" and "Times" baths, their "Barrhead" closets,

their "Modern" lavatory, &c. The baths named above possess the following strong points:—In the cases of the "Fin de Siècle" and "Modern" instead of concealed standing waste and overflow there is an open recess in which the valve rod works,

and which is finished like the interior of the bath. The grating, of specially large size and opening, is fitted above valve with a slotted or bayonet catch arrangement, so that it can be removed with the fingers for cleaning or other purposes. The valve rod being usually of strong nickel-plated brass, and working through

THE EMBARKMENT FOR THE ISLE OF CYTHERA

See Article, p. 184.

this grating, is a most cleanly, strong and simple arrangement. The overflow is cast on immediately behind the waste recess, and enters the waste just above seal of trap. Every time the taps are turned on, a special nozzle, led from the taps to the top of overflow, throws a jet of clean water down the sides of

The trap is made a circular full way throughout, glass enamelled inside, and being removable and adjustable to suit different directions, it is much preferable to the older forms of dip trap. A flange is put on the trap at floor line for a neater finish. The hot and cold taps are of the best screw-down description, and are covered by a massive slab of porcelain, containing two commodious soap trays. The whole apparatus is a combination of the most "up-to-date" ideas on sanitary science, and, besides, the shape and style of finish of the bath are of the newest and most improved description. An open overflow, with a connection for overflow pipe, can be made on this bath to suit the requirements of the water companies who insist upon this construction of overflow.

The "Independent" fulfils the sanitary requirements of the age, in that there is an entire absence of wood enclosure, and

the overflow channel, and so keeps it always clean. Furthermore, it is raised as high as possible in the bath, so that the chance of overflow and consequent soiling is slight, except in the case of taps left running with waste valve closed, in which case the overflow is sufficient to take away all the water.

the possibility of filth collecting behind that enclosure is completely obviated. The plunge bath is of enameled cast-iron, with Shanks's patent waste and overflow arrangement. The spray may be of enameled zinc or copper, with an outer casing of zinc enclosing all the pipes, but with a hinged door for access

to the pipes and fittings at any time. The shower is of brass, nickel-plated, and the fittings are Shanks's patent Eureka fittings. The whole thing is perfect and complete in itself. Only three joints are to make and the bath is fixed. Great saving in carpenter and plumber work is secured. This bath is an improved pattern, with circular spray, and with the waste pipe and supply pipes covered in at side of bath. It is enamelled and decorated in best style, and may be finished in various designs.

"The Times" is a plunge-bath with improved standing waste and overflow, cast in one piece with bath; white porcelain slab, with soap dishes covering taps and so securing increased cleanliness; "glass-enamelled" trap, insuring quicker discharge, immunity from choking, and better sanitary condition of waste. Glass-enamelling renders the trap as free from rust as a piece of glass. This trap being made removable and adjustable to any position is much superior to fixed or cast-on traps.

Shanks's new patent "Modern" lavatory is designed to meet a growing demand of sanitary engineers that all fittings in connection with sanitary appliances shall be open and accessible, anything in the shape of concealed waste pipes and inaccessible valves not being looked upon with favour. The difficulty has been to combine neatness and beauty of appearance with exposed discharge arrangements and perfect accessibility of all parts. Shanks & Co. believe that a combination of this kind has been attained in their new patent "Modern" lavatory.

The ordinary plug and chain has been avoided, and an entirely new system of waste-pull has been adopted. At the back of the basin an open recess is made, over the top of which there is a projection in porcelain, as shown, through which the waste-

pull works. The valve rod, being of nickel-plated brass, is not an eyesore in the basin, and is perfectly cleanly. Quick discharge is looked upon as an important point by everybody, and particular attention has been paid to this in the "Modern" lavatory, which will discharge in less than one-half the time of ordinary basins. The outlet grating is of specially large size and opening, and is fitted above the waste valve with the slotted or bayonet catch arrangement, previously referred to. Insufficiency of overflow has been a defect in many lavatories, and this lavatory has been so constructed as to carry away the water from both taps, running full bore, with the waste valve shut. Two small orifices are arranged for sending a little stream of water down the overflow, in order to keep it always sweet and clean; other two jets impinge upon the grating, so that it may always be cleansed; while the other perforations introduce the water direct to the basin. The taps are fitted into a special recess made for them in the basin, and are perfectly simple and strong in construction. This method reduces materially the amount of brasswork shown in the lavatory.

The school lavatory range, with strong fireclay enamelled basins of improved shape, accessible overflow, top, front frieze skirting and basin in one solid piece, is well worthy the attention of school boards. The basin is large and shallow, so that a wash may be obtained with a small quantity of water. The taps are self-closing or otherwise, as may be desired. Discharge with the ordinary plug and chain, or on the new quick-discharge principle, and a recess is made at the back of basin to accommodate it and take it out of the way. The soap dishes drain into basin, and the cover of overflow is easily removed for cleansing purposes. The waste is a horizontal pipe made in cast-iron, painted, and the standards are also in cast-iron, painted. Instead of standards the basins may be supplied with brackets for building into wall. It is a cleanly, durable and compact arrangement.

Among the closets shown are the "Levern," the specialty of which is that the siphonage is produced by the direct action of the water from the service-pipe, and notwithstanding the great depth of seal, the contents of the basin are completely discharged with the most powerful suction, and the basin is again filled up with clean water from the cistern. The lower part of the long leg of the siphon is of specially patented construction, and is made of lead. The lead is soldered direct to the earthenware by Shanks's patent process, so that a perfectly tight and indestructible joint is secured, being in accordance with the requirements of the London County Council,

and the "Combination" silent closet and cistern, in which the instantaneous flush compensates for lack of height and gives perfect results. It must not be supposed that these closets are suitable only for situations where height for overhead cisterns is not attainable. They are suitable for all situations. They are strong and simple, easily fitted and not liable to get out of order. They are much more silent than closets with overhead cisterns. Large numbers of these closets have been fitted in private houses and public institutions all over the world and have given unqualified satisfaction. As drain flushers they are much superior to closets with overhead cisterns. An eminent sanitary engineer has made experiments and has calculated that the discharge from this closet rushes through the soil-pipe in three times the volume of that from an overhead cistern. Many improvements in construction have been effected since they were first introduced. They are fitted with special full-way silent ball taps, and are so silent in action that they cannot be heard outside the walls of the room in which they are fitted. We have only mentioned a few of the more striking features of a stand which contains much which is interesting and noteworthy.

*United Asbestos Company.*

A stand which will attract deserved attention is that of the above company, who are exhibiting some very fine specimens of their patent "Salamander" decorations, which, added to the inestimable advantage of being absolutely unflammable, possess those of extreme lightness and comparative cheapness. The designs are the productions of leading artists, and are at least equal to any in the market. The material is capable of decoration in any manner, and the style can be altered at any time subsequently as desired. Among the specimens shown are patterns suitable for dadoes, friezes, fillings, ceilings, panels, pilasters, &c., and in many cases they are remarkable for the extreme sharpness of the relief, in which respect they are indistinguishable for plaster mouldings costing twice or three times the amount, while they are superior to these in the fact that they cannot chip or fracture. We are informed that "Salamander" has been extensively adopted by the Lords of the Admiralty for use in H.M. Navy as a protection from fire, and battleships now building are being fitted therewith. It was also selected by the White Star Steamship Company for the decoration of the walls and ceilings of their special building at the Chicago exhibition, representing the smoking saloons and state-rooms of their magnificent steamers *Teutonic* and *Majestic*.

It is now, in fact, extensively used for buildings of every description, and especially where it is desired to combine economical, effective and sanitary decoration with additional security from fire, as, for instance, in public buildings, museums, picture galleries, theatres, hospitals, asylums, industrial schools, hotels, mansions, residential chambers and all kinds of wooden structures. Among the samples of decorated work a very attractive frieze—an entwined garland of flowers and foliage finished in natural colours in bronze paint—cannot fail to be admired alike for its boldness and originality, and several dadoes and panels also finished in bronze colours have a very pleasing effect.

*The Sandstone Syndicate of London.*

At stand 90, row B, the above company are showing some specimens of their artificial sandstone, which has proved thoroughly successful in England, as it has been for some years on the Continent, where it has given general satisfaction to those who have used it. It has been subjected to pretty severe practical tests, and has weathered well in exposed positions; for instance, it is said that in a building in the West End of London, of which a small portion is in Portland stone, the difference now between the Portland and the Syndicate's stone cannot be told by mere examination. The stone has been used pretty extensively in the heart of London, and the atmospheric test has demonstrated its value. Buildings completed with the stone can be seen, amongst others, at 56 Charlotte Street, Fitzroy Square, 92 Chancery Lane, several houses in course of construction at Wells Street, Oxford Street, &c. The stone has also been used for numerous houses, shops and cottages in the suburbs. The Syndicate claims special attention to its stone on the ground that the purchaser obtains a stone equal to Portland at a less price than Bath stone.

*The N.A.P. Window Company, Limited.*

This firm is showing a fine series of examples of their steel in-and-out opening casements. These casements embrace a variety of inventions which have been perfected with great care during the past few years at considerable cost. Every method is guaranteed to be perfectly water-tight in any situation. As the novel parts of each casement form the subject-matter of separate Royal Letters Patent, almost any desired combination of the patented parts is possible. The company is thereby enabled to comply with the special wishes of architects upon matters of detail. All movable parts are of gun-metal. All

445 OXFORD STREET, LONDON, W.

non-movable parts are of rolled steel of a high grade, possessing great strength and rigidity. Consequently the casements are much lighter in appearance than if they were of iron. The advantages claimed for these casements are the following:—

They open for ventilation in the same way as ordinary casements, and each is secured while open or shut by the usual casement-stay and fastener. When it is desired to clean the outside it is only necessary, before swinging the casement inwards, to lower the sill water-bar in the case of the "slip patent." With respect to each of the other methods illustrated the operations necessary prior to opening the casements inwards are equally simple. They effect a considerable annual saving on the cost of window cleaning, and thereby earn a handsome dividend (from 10 to 30 per cent.) upon the very small additional expenditure which their adoption entails. As they open outwards for ventilation, fresh air can be admitted without disturbing the window drapery, a desideratum which is absent from an inward-opening casement. Repainting or reglazing can be conveniently done from within, and the injury which the use of ladders (carelessly handled) does to the sills and window masonry generally is thereby obviated. The absence of risk to life or limb attending the cleaning or repair of the N.A.P. casements enables owners and occupiers to avoid all the moraland legal liabilities generally connected with every "window-cleaning accident." The specimens shown comprise:—The patent N.A.P. sliding and revolving sashes, in ordinary cased frames, as issued to their contractors by the London School Board; the patent N.A.P. "sliding and revolving" sashes, in patent "weightless" frames, obviating the use of lines, weights and boxing (this model shows the special fittings for asylum windows, to comply with the regulations); the patent N.A.P. sliding sashes, divided stile "top suspension" patent, in ordinary cased frames, for use where bars outside the windows or other obstructions prevent the sashes from revolving; the N.A.P. "top bolt" patent for the alteration of existing windows; the patent N.A.P. double-knuckle wood casement, to enable casements to open both outwards for ventilation and inwards for cleaning; the patent N.A.P. "gearless" fanlight fittings, for centre-hung lights; the patent N.A.P. "passable" cheeks for bottom-hung lights, enabling them to be brought over into the room for cleaning; the patent N.A.P. "flush" stay top-hung fanlight (inward and outward opening); the patent N.A.P. steel "slip" casements (opening outwards for ventilation and inwards for cleaning); the N.A.P. No. 2 rolled iron side-hung casement (opening

outwards only); the patent N.A.P. No. 3 rolled iron side-hung casement (opening outwards only); the patent N.A.P. steel top-hung light (opening outwards for ventilation and inwards for cleaning); the N.A.P. No. 1 rolled iron bottom-hung light fitted with "passable" stay; the N.A.P. No. 1 rolled iron centre-hung light; the N.A.P. leaded lights.

#### *Waller's "Grip-fast" Tile Company.*

This company have erected a structure representing a full-sized house, showing with admirable effect the application of their tiles to various portions of the building. As is already well known, Waller's "Grip-fast" tiles are composed of the very best Portland cement, sand and other materials, and made under pressure of 40 tons to the square inch by the most modern and improved patent machinery, specially adapted for securing the efficient handling of the cement used in their manufacture. Having a glazed surface introduced by special process they afford great weather resistance, being wholly impervious to moisture in any shape. Tiles made of sand and cement are not impaired by frost, and, owing to the nature of the materials used, are practically imperishable, and improve with age and weathering, unlike clay tiles and slate, which, from the nature of their composition, more or less rapidly deteriorate. They are made in nine different shapes and in any colour, with a surface almost equalling polished granite. The various shapes all interlock, whereby handsome designs in different colours are readily made, and a neatness of appearance arrived at which in these days of elaborate and aesthetic ornaments is so essential. These tiles are specially adapted for churches, Board schools, mansions, dwelling-houses, railway stations, barracks, and all kinds of public and private buildings, and are capable of being used as low as one-seventh pitch, and are well suited for mansard roofs. They can be readily cut without interfering with the locking arrangement, and in the case of hips and valleys require to be treated as an ordinary slate roofing. As an instance of the rapidity with which they can be prepared for the market, it may be mentioned that those used on the roof of the building in question have been made within the last two days and are in perfect condition for use.

#### *F. McNeill & Co.*

Immediately facing the principal entrance will be found a compact little stand on which Messrs. McNeill & Co. are showing the various purposes to which their slag wool or

silicate cotton may be advantageously applied. Slag wool is essentially a pure mineral glass-like fibre, manufactured from iron slag. It is made by converting this while in a melted condition into fibres by means of a blast of steam or air. It consists of a mass of very fine fibres varying somewhat in thickness, interlacing and crossing each other in every direction, thus forming an innumerable number of air cells. Slag wool partakes of the nature of glass without its brittleness, the fibres being soft and pliant though inelastic. One of its most important qualities is its unequalled power to prevent radiation of heat or transmission of hot or cold air. No other material, either natural or manufactured, which can be used practically in the arts approaches this as a non-conductor of heat. This can readily be accounted for by the fact that slag wool holds in confinement a greater proportion of air than any other material. It is a perfect protection against frost, and is perfectly non-combustible, and practically indestructible by heat; therefore, as a protection against fire, it may be of inestimable value if rightly applied; and indeed, the use of wire lathing or wire-netted slag wool slabs in connection with the filling of slag wool between the studding is being now largely adopted by progressive architects and builders. It is largely used in car-building and for other railway purposes, as a pipe and boiler covering and in many other ways which we have not room to specify.

Messrs. McNeill have another speciality in their patent damp course, which consists of a layer of thin sheet lead between two layers of bituminous felt. This has already been used with very satisfactory results, and promises to be taken up as an indispensable adjunct by all conscientious builders.

*Ewart & Sons.*

Messrs. Ewart & Sons have two large stands facing each other in Row A. On these they are exhibiting an imposing selection of specimens of their deep stamping in copper, consisting of copies of life-sized figures in full relief designed as architectural ornaments for some buildings which have recently been erected in Siberia, where the climate in a very short time proves fatal to any kind of stone ornament. These copper ornaments, which comprise, in addition to the figures mentioned, capitals, panels, mouldings, masks, balustrading, &c., are absolutely impervious to climatic influence; they are extremely light, and although they can be painted to imitate stone, if such treatment be approved of, or from any cause desirable, if applied *au naturel* they rapidly

acquire a delicately-tinted bluish green patina which is distinctly pleasing. Another important feature of Messrs. Ewart's display is their copper "Crown" and "Standard" ventilators, of which they have several varieties on show. These ventilators possess the valuable qualifications of extreme efficiency, lightness, sightliness — indeed they are really ornamental — extraordinary durability, and comparative cheapness. They, moreover, require no woodwork in fixing. The same patterns can be supplied in zinc at considerably less cost; but, of course, they will not last anything like so long. Messrs. Ewart have a method of flat roofing in copper, which is also shown.

*Johnson Manufacturing Company.*

The patent hinge front pulley exhibited by this firm has the advantage that it can be opened after the sash is hung, for access to the interior for oiling or cleaning, which prevents undue wear on the axle, and causes it to run freely and silently. The wheel and axle are solid gun metal, revolving on free bearings. It is impossible for the wheel to bind, which is frequent with ordinary pulleys, and the direct cause of cords breaking. It can be opened and oiled in one minute. It will be found very useful in hospitals where it is necessary that sashes run silently, and has already been used in many of the largest railway station hotels, infirmaries, lunatic asylums, barracks, and mansions, with great satisfaction.

### THE NEW INCANDESCENT GAS LIGHTING COMPANY.

THE New Incandescent (Sunlight patent) Gas Lighting Company, having triumphantly emerged from the worries of litigation, are now coming rapidly to the fore, and we recently had the pleasure of inspecting their well-equipped show rooms at 33 and 34 Shoe Lane. The light given by their patent burners equals that of three ordinary burners, and has the advantage of being free from that greenish tinge which one usually associates with incandescent burners, and which so many find disagreeable and unsuitable for domestic purposes. It has in fact a warm tone very closely approaching to that of sunlight, whence its name. It is also claimed that the mantle is more durable than any other in the market.

We were especially interested in the artistically designed fittings, too, the lines of some of which are extremely graceful, for which reason they are likely to very speedily supersede the

old clumsy form of gasaliers and brackets to which we have grown accustomed, but which can scarcely be said to have been at any time particularly satisfactory or pleasant to look upon, even though they served their plain utilitarian purpose well enough. A novelty introduced by the company is their electric lighter, which is affixed to the burners, and to which the power is supplied by a very small battery which could be easily hidden away in the corner of any room. This obviates the need for the bye-pass, which, although extremely useful and in some cases hitherto indispensable, is not without its disadvantages. Owing to a prevalent misconception the company have found it necessary to issue a circular, from which the following is an extract:—"It has come to our knowledge that our mantles are being used upon imperfect cheap burners which give poor and miserable results. We have tested some of them, and the utmost illuminating power that we have been able to obtain with our mantles has been 17 candles, whereas if our mantles are used upon our own burners, which are specially constructed for their use, they will give about 50 candle-power."

### VARIETIES.

THE late Sir Thomas Elder has bequeathed 155,000*l.* for public objects in Adelaide, including 65,000*l.* for the university, 25,000*l.* for a picture gallery and 25,000*l.* for workmen's houses on the lines of the Peabody Trust.

ADDINGTON PARK, one of the residences of the Archbishop of Canterbury, is to be sold. Part of the purchase-money is to be used for building a house for the Primate in Canterbury.

THE next ordinary general meeting of the Surveyors' Institution will be held on Monday, March 22, 1897, when a paper will be read by Mr. C. H. Hooper (Fellow), entitled "Fruit Growing as an Auxiliary to Agriculture."

THE foreman and ganger employed at the Coldrenick Viaduct on the 9th ult., when a platform collapsed and twelve men lost their lives, were charged on the 16th inst. at the Liskeard Police Court with criminal negligence. After hearing evidence during several hours the magistrates dismissed the case.

THE awards of Mr. W. Ambrose, Q.C., M.P., the arbitrator appointed by the Local Government Board to hear claims amounting to 17,619*l.* by property owners and tenants against the Leigh District Council, as compensation for property sought

to be acquired for public improvements, has been received. The total amount offered by the Council was 5,876*l.*, and the total amount of the awards is 6,797*l.*, or about 15 per cent. more.

THE Harbour Commissioners have had under consideration a report by the works committee in regard to the condition and repair of the Aberdeen graving dock, which was opened in July 1885, at a cost of 54,321*l.* The harbour engineer recently reported that the condition of the dock and return walls was such as to call for immediate treatment, and that no method of repair would be of permanent avail which did not provide for their entire reconstruction. The committee, therefore, recommended that the dock should be reconstructed on its present site and lengthened, deepened and widened at an estimated cost of 118,600*l.* The committee also recommended that the work should be executed in granite masonry and brickwork, Portland cement concrete being only used in situations where it would not enter into the structural features of the work, and where it would be entirely protected from sea water. A long discussion took place, there being great diversity of opinion as to the advisability of the Board undertaking so large a work in the meantime, and in the end it was resolved by nineteen to ten to refer the whole matter to a consulting engineer for a report. The minority were in favour of the committee's recommendation being adopted. Mr. Dees, Glasgow, and Mr. Wake, Sunderland, were suggested as consulting engineers, but it was agreed to leave the matter in the hands of the works committee.

THROUGH passenger traffic was opened on the 8th inst. between Chesterfield and Lincoln by the Lancashire, Derbyshire and East Coast Railway, which, besides relying on passenger traffic, is likely to become a great coal-carrying company, as it is opening out a new field of colliery enterprise in the district commonly called "The Dukeries," extending to the east over nearly 300 square miles, practically virgin soil. The first length of line, between Lincoln and Edwinstowe, was opened for traffic last December, and on the 8th inst. the section between Chesterfield and Edwinstowe was opened, including also branch connections from Langwith to Clowne. These portions of the railway, representing a length of 30 miles, have been constructed through one of the roughest and most difficult engineering parts of England, running right across the grain of the country, requiring heavy embankments and excessively deep cuttings. A tunnel at Bolsover, 1½ mile long, runs through coal measures, and a viaduct at Chesterfield crosses in one span the Manchester, Sheffield and Lincolnshire Railway, the Midland Railway and the Derby road. The station at

Chesterfield is designed on a large scale to accommodate very heavy goods traffic. A Bill is now in Parliament for an extension of the line from Lincoln to the east coast at Sutton-on-Sea, where a deep-sea harbour is to be constructed to enable coal to be carried to London and abroad by sea. Mr. Elliott Cooper is the engineer for the whole section, and Messrs. Pearson & Son are the contractors for the line between Chesterfield and Warsop.

## BUILDING AND BUILDERS.

THE Aberdeen Parish Council are about to erect new offices in Union Terrace, which will cost about 6,000*l.* The price of the site was 3,700*l.*

THE Salford School Board are about to erect a school for 1,200 children in Langworthy Road.

BATHS are to be erected in Chester on the south side of Union Street.

THE Prince of Wales's Hotel, on the borders of the Lower Lake, Killarney, has been commenced. Messrs. Waring & Sons, Limited, will carry out the decorations and supply the furniture.

A MARKET HALL is to be erected in Ripon as part of the memorials of the Jubilee celebration. The Marquis of Ripon has offered a site, containing 1,700 square yards, for 2,500*l.*

THE barracks at Winchester are to be rebuilt at a cost of 72,000*l.* The style of the palace, which was copied from that of Versailles, is to be preserved as far as possible, and the adjacent old county hall is not to be interfered with.

THE site for the Grand Central Hotel in front of the terminus in Marylebone Road, of the Manchester, Sheffield, and Lincolnshire Railway extension to London, is now being cleared, and building operations will be forthwith commenced. The new hotel will, it is said, be on the same scale of magnitude as the Midland Hotel in Euston Road.

THE Bill promoted by the Manchester Ship Canal Company will pass as an unopposed measure through the House of Lords, no petitions having been deposited against it within the time allowed by the Standing Orders. It empowers the company to grant leases of land "for the erection of warehouses, transit sheds and other buildings calculated to promote or facilitate the business of the company."

THE Jewish community in London propose to celebrate the sixtieth year of the Queen's reign by erecting and endowing a home and hospital for Jewish incurables at Tottenham. A site of close upon four acres has been acquired, and accommodation will be provided for fifty patients. The scheme is expected to involve an outlay of 20,000*l.*

COWPER Church, East Dereham, which is built on the site of the poet's house where he spent his closing years, is to be completed by the erection of a clock-tower at a cost of 500*l.* In the vestry is preserved the woodwork of the bedroom in which Cowper died, the door being in actual use, and in front of the church stands a polished granite monument to the poet's memory.

At a public meeting held on the 8th inst., it was decided to carry out the plans for the full scheme of the renovation of the parish church, Kingswood, Bristol, prepared by Mr. E. H. Lingen Barker, of London and Hereford. The scheme embraces practically new nave, aisles, chancel, organ chamber and two porches and new floors and fittings. The floor of the western tower will be utilised as a choir vestry. The accommodation is for 675 worshippers.

## THE HIGHGATE WOODS.

FOR some time past, says the *Times*, the public have been in possession of an offer of great importance to London. The Ecclesiastical Commissioners are the owners, in right of the see of London, of a large estate at Highgate. It is unnecessary to say that the land lies high, and has many steep slopes and breezy hilltops. Here and there are old woods, chiefly of oak, with an undergrowth of hazel and willow; they are said to be remnants of the old Forest of Middlesex, in which the Corporation of London had a right of hunting by Royal charter. Recently they have been managed as copse-lands, the underwood being cut periodically, and, if not marked by the peculiar diversity of an open forest, they are still charming bits of woodland, bringing the country to the threshold of London. Two of these woods, Gravel Pit Wood and Churchyard Bottom Wood, lie together, separated only by a high road. Gravel Pit Wood was some years ago made over as a free gift by the Commissioners to the Corporation of London; it is now dedicated to the public and managed by the Corporation as an open space. It was understood at the time this handsome present was made that Churchyard

**P. A. GILBERT WOOD,** 175 STRAND, LONDON, W.C.

Bottom Wood should, if possible, be purchased for a similar purpose, and the Commissioners, after consideration, fixed its price at 25,000/. The wood contains 52 acres, and the price thus represents less than 500/. an acre. Any one acquainted with Highgate and aware of the rapidity with which new roads are being laid out and new houses springing up in that neighbourhood will be of opinion that the sum asked is a moderate one, probably much less than the Commissioners would realise were they to throw the land into the market. It is certain that far higher sums have been paid for other open spaces acquired for the public in recent years—for Parliament Hill and the adjacent fields, for example, or for the Hilly Fields at Brockley.

Circumstances have led to some delay in meeting the Commissioners' offer. But within the last six months a vigorous effort to raise the necessary money has been set on foot in the locality. Highgate, few people perhaps know, is not a parish in itself, and lies for the most part outside the county of London in the parish of Hornsey. The Hampstead and Highgate hills have always formed a species of barrier on the north of London, and perhaps it was on this account that, when the boundaries of the Metropolis were defined in 1855, Hornsey was left outside; doubtless, too, in those days it was a purely rural district. Part of the parish is, we believe, within the four-mile radius, while London is rapidly spreading round it and over it. The population, which in 1851 did not reach 2,000, is now over 50,000. This populous and rapidly increasing district is under the jurisdiction of an urban district council, and that body has voted 10,000/. towards the sum required by the Ecclesiastical Commissioners, and has expressed its willingness to accept and take charge of the wood. The example thus wisely set has been emulated by a local committee, which, under the guidance of Mr. Cory Wright, has succeeded in raising between 2,000/. and 3,000/. by local subscriptions, Mr. Cory Wright himself being a munificent donor. There remains some 12,000/. to be made up. To secure this sum a joint committee has been formed of the rural open-space societies and the local organisation, and appeals have been made to the County Councils of London and Middlesex, the vestry of Islington, and other bodies and persons. Were the wood inside the county of London, there cannot be a doubt that the comparatively small sum required would be forthcoming at once. The fact that Parliament has drawn the boundary of the county just inside the wood, though it raises some technical questions which may render it necessary to invoke the aid of the Legislature, does not affect the real value of the wood to London.

It is nearer the centre of the Metropolis than Hammersmith or Woolwich, and it will serve a district peculiarly in want of breathing-ground. The area of open space in proportion to population is far smaller in the east than in the west of London. The great district which lies north and north-west of the City—Dalston, Barnsbury, Canonbury, Highbury, Islington—is thickly populated and possesses no large open spaces such as the Royal parks. Clissold Park, Stoke Newington—acquired about ten years ago by the aid of the funds of the City parochial charities—and Finsbury Park are the only open spaces worth mentioning in this wide district, and taken together they are of no great extent. The district is, however, traversed by lines of railway which run from the very centre of London—Broad Street, Aldersgate, Moorgate—to a station (Highgate) within a stone's throw of Gravel Pit and Churchyard Bottom Woods. Thus, if the latter wood be saved, an area of 120 acres of woodland will be made accessible to one of the most crowded quarters of London, and on the very summit of the Highgate hills the capital will possess an open space combining the attractions of tree and bush, thicket and glade, with those of fresh air and a wide outlook. The offer of the Ecclesiastical Commissioners remains open till the end of June; it is to be hoped that before then the necessary funds may be secured and arrangements made which will put the wood beyond danger.

### SOOT IN CHIMNEYS.

ON the 6th inst., at the Westminster police court, Mr. Henry Cunynghame, legal Assistant Under-Secretary at the Home Office, appeared as the occupier of 36 Eaton Place, S.W., to answer a summons by the London County Council, under the Metropolitan Fire Brigade Act, the chimney of the house having been on fire on January 24 last. Mr. Sherwin White, who conducted the case on behalf of the London County Council, called a fireman to show that a somewhat serious fire was discovered in the chimney. The man was engaged three hours in putting out the burning mass of soot. Mr. Cunynghame said he would like to suggest to the fire brigade that, if they would use carbonic acid instead of water in putting out these chimney fires, they would find that not only was it more effective, but that a great deal of damage would be prevented. He understood that when carbonic acid was used within the confined space of a chimney it put out a fire there immediately. Even

ordinary washing soda had been known to prove equally efficacious, and he believed that if the authorities made a charge for the use of these means of extinction householders would willingly pay. As a matter of fact, the chimney of his house had made him responsible for a bill for 27*l.*, considerable damage being done to the wall owing to the bad practice of pouring water down the chimney. Happily, the insurance company came forward and settled that matter. In answer to Mr. White, the fireman said the chimney was very foul, and his opinion was that the cracking of the wall was due to the overheating of the soot in the chimney, and not to the action of the water. If carbonic acid had been used, half a ton would have been required before it would have reached the fire in question. The chimney was a very large one. Mr. Marsham observed that he had never before heard of a chimney fire being put out by carbonic acid. Mr. Reed, the builder and master sweep called in by Mr. Cunynghame to execute the necessary repairs after the fire, said many instances had come to his knowledge where the free use of water in cases of this sort had proved dangerous. He had found ordinary soda mixed with warm water, and poured out with a cup, prove very efficacious. The chimney in question was a peculiar one; there were about eight bends, and these of course readily lent themselves to the accumulation of soot. Mr. Marsham expressed the belief that the County Council would not now sanction the construction of such faulty chimneys, and imposed a fine of 2*s.* 6*d.* and 2*s.* costs.

### THE TRAFFORD PARK ESTATE.

RAPID progress is now being made, says the *Manchester Guardian*, in the development of the Trafford Park Estate, and details of the scheme for laying out the 1,183 acres of which the estate consists will shortly be forthcoming. The land is mainly to be made available for commercial purposes, taking advantage of its position—bounded for three miles or more on one side by the Ship Canal and on others by the Bridgewater Canal. From below the Manchester docks to the Barton aqueduct the Ship Canal has an extra width of 50 feet, which will enable vessels of large tonnage, without interfering with the ordinary navigation, to lie alongside wharves which the owners of the estate are empowered to construct upon their land abutting on the canal. Under the scheme as it stands, about 100 acres are being reserved for dockside purposes. An im-

portant feature in the development is the proposed construction of lines of railway which will belong to the estate, to connect with the Manchester dock railways, and through them with the whole railway system of the district. One portion of the estates railway is to be worked as a tram line, to convey passengers through the park between Old Trafford and Barton, and it may be of interest to mention that it is intended to use trams propelled by gas-power. The line will be, however, of ordinary railway gauge, and adapted also to the conveyance of merchandise to and from the docks and the various works upon the estate. Power will be sought, probably during next month, for the construction of the railway under the Light Railways Act. It is to run from Chorlton-cum-Hardy to Barton, being connected up at the former place with the systems of the Midland and the Manchester, Sheffield and Lincolnshire Railway Companies. If the Midland Railway Company should obtain the powers they are seeking in Parliament to construct a line between New Mills and Chorlton—which will have the effect of greatly shortening the route—there will be a straight approach by the main line from Derbyshire right on to Barton. Eventually, no doubt, the railway will cross the canal where the land is high, just above the Barton Bridge, on to the Eccles side, and in this way join the London and North-Western and the Lancashire and Yorkshire Companies' lines. As the whole estate is practically level, it is proposed not only to give railway communication to all parts of the land sold for manufacturing purposes, but also to make lay-byes and basins connecting with the Bridgewater canal. The southern part of the estate is triangular, as the Bridgewater Canal from Manchester on the one hand, and from the Leigh and Worsley direction on the other, makes an angle at Water Meetings. By the projected canal the angle will be cut off, and the estate thus further opened up. The other features contemplated include a coal barge tip, the uses of which seem likely to be appreciated. The space set apart for ironworks, seed-crushing mills, cotton mills, malting houses, machinery works, merchants' dépôts and other purposes of the kind extends over about 750 acres. We understand that undertakings are already in progress which will require sites for purposes such as have been indicated. Negotiations are also in progress, it appears, for the erection by corn merchants, acting in conjunction with the owners of the estate, of a grain silo on the American principle, to be situated near Trafford wharf, abutting on the Manchester docks. The estate is not, however, to be devoted wholly to commercial uses. A

THE WELL-KNOWN FRIEZE,  
ENTITLED

**"THE CORN FIELD."**

1. PLOUGHING; 2. HARROWING; 3. MOWING; 4. CARTING; 5. THE PRODUCTS OF THE CORN FIELD.

Length, Fourteen Feet Seven Inches by Fifteen Inches deep.

A Splendid Example of Colour-Work in Permanent Ink Photo,  
BY M. PAUL ALBERT BAUDOIN.

This magnificent Illustration was presented to the Subscribers to "The Architect" in 1886. A few Proofs were taken, which immediately became out of print.

OPINIONS OF THE PRESS.

"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition is being issued."—*The Lady's Pictorial*  
"They are beautifully done in colours by the permanent ink photo process, and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—*The Stage*.  
"The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour-work in permanent ink photo, by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic, and would grace the walls of any house."—*The Gentlewoman*.

AND NUMEROUS OTHERS.

In consequence of the almost daily demand for these Plates, they have been reproduced by Subscription at Half a Guinea the Set, and are now ready for issuing.

P. A. GILBERT WOOD, 175 Strand, W.C.

May be had framed in Solid Oak Frames with Mounts, at Three Guineas the set of Five Plates.

central space of about 200 acres is being reserved for a race-course or public park, though we are not aware that any project is on foot to acquire the land at present for either purpose. It is perhaps some recommendation of this portion of the estate as a racecourse that it would afford a straight mile. As for the hall and the adjoining buildings, they are to be converted into a first-class hotel, the gardens and a portion of the park being reserved for golf links and a recreation ground.

### KILLALOE SLATES.

At a meeting of the Killaloe Slate Company, which was held on the 11th inst., Mr. S. H. Bolton, builder, the chairman, in declaring a dividend of 10 per cent. per annum, said that heretofore there seemed to be a great difficulty in inducing Irishmen to use Irish material; but he was glad to see they were getting over that, and that Irishmen generally were getting more patriotic, or a little more keen in promoting the material welfare of their country. The architects, in whom had lain the principal difficulty as to the selection of Killaloe slates, were finding out now that it was advantageous for the proprietors, as well as for the public generally, to use Killaloe slates, because the money expended on them more or less came back to everybody in the country, and in that way anything that was manufactured and used in Ireland was of advantage to the whole country. Irish architects appeared latterly to appreciate that fact, and the company had some very good friends among them who always specified their slates. Unfortunately, nowadays there was a feeling in favour of foreign articles of every sort. But the Killaloe slate, he was glad to say, was holding its own. The difficulty was to turn out slates sufficiently rapidly, for, as the report stated, the demand was almost in excess of the supply.

### NOTTINGHAM GENERAL HOSPITAL.

THE following report of the committee appointed to take into consideration the desirability of extending the Nottingham General Hospital was read and adopted at a special meeting on the 10th inst. :—

The main block of the hospital was built in 1782, and contained about sixty beds, the population of the town and county at that time being about 100,000. In 1854 the old building was

raised a storey, and in 1878 the new surgical wing, adjoining Park Row, was added, increasing the beds, with temporary isolation hospital, to 175, which is their present number. The population of the town and county is now estimated at about 500,000. The hospital is always practically full, and much delay frequently and necessarily occurs in the admission of patients who require treatment. The number of patients which have at some time in each month of 1896 been waiting for admission has been as follows:—January 46, February 46, March 42, April 46, May 47, June 72, July 74, August 87, September 86, October 54, November 39, December 35. Should this want of accommodation be allowed to continue, in the event of any serious railway or other accident great additional inconvenience and suffering would ensue. Your committee, after careful thought and consultation with the medical committee, are of opinion that an addition of at least fifty beds is urgently required. The wards in the main block of the hospital, which are now 115 years old, have no through ventilation, being on two sides of a central corridor. The plan almost universally adopted in modern hospitals of having the patients in isolated wards, with windows on both sides, undoubtedly conduces very much to their comfort and recovery, and your committee therefore think it very desirable that all the wards of the hospital should, if possible, be arranged on that principle. At the outset your committee considered the matter from two points of view—one the demolition of the old building and the erection of an entirely new hospital, and the other the remodelling of the old building and, if possible, its adaptation to modern requirements. Your committee have had the valuable advice of Sir Douglas Galton (whose honorary services they wish gratefully to acknowledge) and of an architect (Mr. Aston Webb), as well as an opinion on the present condition of the building from a builder (Mr. Woodsend). Their reports may be seen at the hospital. The erection of entirely new buildings, with the exception of the existing accident wards on Park Row, would no doubt be most completely satisfactory, but if funds are not forthcoming for that, then the scheme which seems to your committee likely to prove the most thoroughly satisfactory would be to erect new wings of the most approved construction, using the present building for administrative and other purposes. At present a large number of the nurses sleep in small houses, which are most unsuitable quarters for them, and the sleeping accommodation for the staff generally in the hospital is very unsatisfactory and inadequate. Plans carrying out this idea have

been made by Sir Douglas Galton and Mr. Aston Webb, and may be seen at the hospital. If a plan on this general principle were adopted, nearly all the 225 beds would be in buildings of modern construction, there would be other beds available for emergencies, and the staff, nurses and servants would have most excellent accommodation. In addition to this, a proposed new entrance would make access to the hospital far more convenient than it now is, especially for badly injured patients, the out-patient department would be reconstructed, the laundry would be placed in a situation where it would be capable of doing the work for a larger number of patients, the whole place would be most airy and pleasant; and, standing, as the new wards would, on a site probably unequalled in England for a hospital, would be a noble ornament to the county and the town. To fully and satisfactorily complete the scheme with all necessary accessories your committee think that 50,000*l.* should be raised. Your committee do not, however, recommend any particular scheme for final adoption, as it would probably be more satisfactory in a matter of such importance if a competition from a limited number of architects were invited before a final decision on the suggested scheme is taken. They, however, are confident that they have sufficient information to justify the Monthly Board making an appeal to the governors and the general public for the necessary funds to enable the Board to make the hospital worthy of the county and the town.

### THE DEVELOPMENT OF ILKLEY.

WHARFEDALE, says the *Leeds Mercury*, has the proud distinction of being the most charming of Yorkshire's many valleys. Tens of thousands of the toiling masses huddled together in the busy, but unlovely, commercial centres of the West Riding, of East Lancashire and of districts even further afield, have many a time and oft sought health and invigoration within the confines of this magnificent watershed. The tourist, the artist, the valetudinarian—all are attracted to this vale, upon which nature has bestowed so many of her most cherished gifts. Ilkley is the Queen of the Dale. The town, or, as some still prefer to call it, the village, has shared to the full in the popularity enjoyed by the locality in which it is so happily and so picturesquely situated. Within the lifetime of the present generation the place has undergone amazing development, but one is probably justified in declaring that even now Ilkley is

comparatively in its infancy. As a sanatorium the town long ago achieved a world-wide reputation, its claims to be regarded as one of the most delightful of residential retreats have only been recognised within recent years. The recognition is however, complete. One after another, in rapid succession, the commercial and professional magnates of Leeds, Bradford and other towns have built themselves handsome villas on the slopes of the bracing moors, and, to quote the familiar phrase of the pantomime manager, "the cry is, still they come." There is a great future in store for Ilkley.

Now for a few facts concerning this progressive community. The census return compiled in 1891 gives the population at 5,767. At the beginning of the present year it was estimated that the inhabitants numbered 7,000. These figures, of course, take no account of the visitors who annually arrive in the town to stay for a longer or shorter period, and it is doubtless safe to calculate that in the height of the season the normal population is about doubled. But perhaps a truer index of the advance which the town has made within the last ten years or so is the increase of the rateable value of the property within its boundaries. In 1887 the assessment was 29,225*l.*; it is now 40,750*l.* Thus it will be seen that the rateable value has been augmented by an average of rather more than 1,000*l.* a year—an eminently satisfactory state of affairs. For the benefit of those curious about such matters, it may be mentioned that the general district rate is now 3*s.* 6*d.* in the pound, and the poor rate 1*s.* 6*d.*

Ilkley is governed by men of foresight and enterprise. The town can give "points" to many municipalities. For example, in 1892 the then Local Board promoted a Bill in Parliament for the compulsory acquisition of the undertaking of the Ilkley Gas Company, and were successful in carrying the Bill through the House of Commons. The Gas Company appealed to the House of Lords, and while the appeal was pending negotiations were concluded for the sale of the undertaking to the Local Board for the sum of 55,000*l.* The works were taken over on January 1, 1893, and have since proved prosperous. The Board also succeeded in 1893 in obtaining the assent of Parliament to a private Bill which contained provisions of no little importance. Under authority then secured, the waterworks are at this moment being extended. The expenditure entailed can be met under special powers to borrow 20,000*l.* Then the Legislature granted the local authorities permission to acquire a site for, and to erect, a town hall and public offices. A suitable site was recently secured for 6,270*l.*, but no further steps have been taken

## THE "E. R. A." PHOTO BLOCK COMPANY,

City Office:—4 & 5 East Harding Street, Fetter Lane, E.C.

*Process Blocks of every description made from Drawings in Pen and Ink Line, or Wash, and Photographs, to print with type, on an entirely new method, giving greater value and effect to the picture, with strong definition of detail.*

*Our special treatment of Pencil Drawings is being largely adopted by Architects, Publishers, and Art Journals.*

For Particulars and Specimens apply to ALFRED FISH, Manager.

## W. DUFFY'S PATENT IMMOVABLE ACME WOOD BLOCK FLOORING.

THE PERFECT FLOORING FOR ALL PURPOSES.

Seven Gold Medals, four Silver, two Bronze Medals, and Certificate of Sanitary Institute of Great Britain.

Full Particulars and Prices on application to

THE ACME WOOD BLOCK FLOORING COMPANY, Ltd.,

Chief Office and Works:—GAINSBOROUGH ROAD, VICTORIA PARK, LONDON, N.E.

with regard to the scheme, there being a substantial body of opposition to it in the town. Power conferred on the Board to close private slaughter-houses has been enforced since February of last year. Public bands may also be engaged at the expense of the ratepayers, but so far no advantage has been taken of this license. This is, of course, a matter about which the inhabitants must be presumed to know best, but they may be reminded that Harrogate is a powerful rival of theirs, and that there a good deal of importance is attached to music in public places. The town band has become quite an institution in Harrogate, and a similar organisation in Ilkley would be thoroughly appreciated by the thousands of visitors who flock thither during the summer months. While on this topic, one might perhaps venture to ask whether the good people of Ilkley have ever taken into consideration the desirability of providing for the entertainment of the "strangers within their gates" who annually bring a fair amount of grist to the mill. The complaint is often made that there is "nothing to do" when the weather is bad. And it can rain at Ilkley.

Reference has been made to the waterworks. The water supply is derived from the adjoining moorland, and is conveyed, practically speaking, direct from the springs to the consumer, the only means of storage being three small reservoirs, with a total capacity of 275,000 gallons. The local authority are at present impounding more springs, and are extending their waterworks system westward. Seeing, however, that the springs already impounded yield 300,000 gallons per day, or 30 gallons per head for a population of 10,000, the extension is rather to meet the needs of the future than of the present. Consequent on the growth of the eastern, or Ben Rhydding, portion of the town, it has been found necessary to devise for that district a separate scheme of sewerage and sewage disposal. Early in 1894 Messrs. Waugh & Mallinson, engineers, were instructed to prepare plans and estimates, but, owing to strong opposition from local landowners interested, progress has been slow, and the works have not, as a matter of fact, yet been commenced, nor have the Local Government Board agreed to the scheme in its entirety, although sanction is now daily expected. The Council have also a proposal before them to extend and enlarge their principal sewage disposal works.

The purchase of Ilkley Moor and the manorial rights was completed on June 29, 1893, at a cost of 13,500*l.*, for which amount the Local Government Board sanctioned a loan, repayable in fifty years. The purchase was brought about by

a threatened enclosure of the moor, and the local authority seeing, with commendable promptitude, that such a course would ruin the future prospects of Ilkley, at once took the matter in hand, and secured the freedom of the moor to the public for ever. The moor is 2,000 acres in extent, and forms, as every one knows, one of the finest "breathing spaces" in the West Riding.

### PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

### APPLICATIONS FOR PATENTS.

- 5439. Walter Scott Wilkinson, for "Improvements in the manufacture of paving blocks, tiles and the like."
- 5531. Christian Albert Jensen, for "Improvements in or connected with earth closets and the like."
- 5532. David Steel Wallace, for "Improvements in water-closets."
- 5543. James Edward Williamson, for "A new or improved sash-fastener."
- 5547. Matthew Abbott, for "A new or improved fastener for windows."
- 5575. Robert Balaam, for "Improvements in bricks."
- 5594. William Leatherby Roughdown, for "An improved shifter and fastener for movable seats and tailboards of carts and such like."
- 5598. Albert Roslington Buckton, for "Tilette (a substitute for earthenware tiles)."
- 5692. Arthur Wakefield, for "Improvements in sanitary and other pipes."
- 5947. Enoch Evans, for "Improvements in or additions to sink and kindred sanitary pipes."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 73 Chancery Lane, London, W.C.

# THE NEW EXPANDED METAL

*Meshes from 1/4th in. to 6 in. wide. Strands from 24 B.W.G. to 1/8th in. thickness of steel.*

**FOR BUILDING CONSTRUCTION**, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

**FOR SOLID PLASTER PARTITIONS**, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

**FOR FIREPROOF LATHING**, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

**FOR CONCRETE FLOORS WITH EXPANDED METAL**.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

**FOR EXTERIOR WALLS OF BUILDINGS**.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

**FOR FENCING, TREE GUARDS, WINDOW GUARDS**, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

**ORNAMENTAL. STRONG. CHEAP.**

**OTHER USES FOR EXPANDED METAL**.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away. Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

**BRASS, ALUMINIUM**, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

**CATALOGUES AND PRICE LISTS** can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

**THE EXPANDED METAL COMPANY, LTD.,**

**39 UPPER THAMES STREET, LONDON, E.C.**

Telegraphic Address, "Distend, London."

Works—WEST HARTLEPOOL.

Telephone No. 1829.

## EDITORIAL NOTICES.

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

## NEW READING CASE.

**To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.**

## CONTRACTS OPEN.

**ABERDARE.**—March 31.—For supplying and erecting lattice girder footbridge. Mr. Wm. Fox, 5 Victoria Street, Westminster, S.W.

**ABERDEEN.**—April 1.—For constructing concrete reservoir and laying cast-iron pipes. Messrs. Jenkins & Marr, architects, 16 Bridge Street, Aberdeen.

**ABERTILLERY.**—March 31.—For building workmen's institute, gymnasium and swimming-bath. Mr. F. R. Bates, architect, 4 Commercial Street, Newport.

**ACCRINGTON.**—April 3.—For alterations to floor and ceiling and supplying cases for museum. Mr. W. J. Newton, Town Hall, Accrington.

**AISKEW.**—For building three cottages. Mr. Robt. Imeson, Sutton Grange, Masham.

**ALDERBURY.**—For building bungalow. Mr. F. Bath, architect, Crown Chambers, Salisbury.

**ALFORD.**—March 27.—For erection of an epidemic hospital. Messrs. James Duncan & Son, architects, Turriff.

**ALNWICK.**—For building villa. Mr. Hope, architect, 40 Westgate Road, Newcastle.

**ASHTON-UNDER-LYNE.**—April 14.—For constructing embankment, &c., for formation of reservoir. Messrs. G. H. Hill & Sons, 3 Victoria Street, Westminster.

**AYLESBURY.**—April 1.—For making roads. Mr. J. H. Bradford, 2 Rickford's Hill, Aylesbury.

**BALLINAMALLARD.**—April 3.—For building school. Rev. George M'Meel, Ballinamallard, Ireland.

**BARDON.**—April 2.—For main drainage works. Mr. J. B. Everard, 6 Millstone Lane, Leicester.

**BARNLEY.**—March 31.—For building house. Messrs. Wade & Turner, architects, 10 Pitt Street, Barnsley.

**BATLEY.**—April 5.—For making-up roads. Mr. O. J. Kirby, Market Place, Batley.

**BECKENHAM.**—March 29.—For supply of broken granite. Mr. John A. Angel, Urban District Council Offices, Beckenham.

**BELPER.**—March 31.—For erecting iron roofs, columns, gutters, &c. Mr. Maurice Hunter, Bridge Street, Belper.

**BIRKENHEAD.**—April 7.—For sinking bore-hole. Mr. George Miller, 9 Hamilton Square, Birkenhead.

**BIRKENHEAD.**—March 31.—For sewerage and making-up roads. Mr. C. Brownridge, Town Hall, Birkenhead.

**BISHOP AUCKLAND.**—April 1.—For erecting movable partitions in school. Mr. S. Adams, School Board Offices, Tudhoe, Bishop Auckland.

**BLAYDON-ON-TYNE.**—March 31.—For flagging and paving streets. Mr. W. H. Stephenson, Urban District Council Offices, Tyne Street, Blaydon.

**BRADFORD.**—April 5.—For partly rebuilding two warehouses. Messrs. Milnes & France, architects, Bradford.

**BRANDON.**—April 5.—For alterations and additions to Board schools. Messrs. E. Boardman & Son, Queen Street, Norwich.

**BRIDLINGTON QUAY.**—April 1.—For building warehouse and coach-house. Mr. Samuel Dyer, architect, Bridlington Quay.

**BRIGHOUSE.**—April 1.—For building three additional storeys at Clifton Mill. Mr. J. F. Walsh, architect, Lancashire and Yorkshire Bank Chambers, Halifax.

**BRISTOL.**—April 5.—For rebuilding warehouse and factory. Mr. Henry Williams, architect, 24 Clare Street, Bristol.

**BRISTOL.**—April 7.—For erecting condensing plant for the electrical committee. Mr. H. Faraday Proctor, Temple Back, Bristol.

**BRIXTON.**—April 1.—For repairing and painting Tate Central Library. Mr. H. J. Smith, Vestry Hall, Kennington Road, S.E.

**BUCKNALL.**—April 1.—For building hospital. Mr. Elijah Jones, architect, Albion Street, Hanley.

**BURNLEY.**—March 29.—For constructing iron pipe sewer. Mr. G. H. Pickles, borough surveyor, Burnley.

**BUSHMILLS.**—April 10.—For enlarging church. Mr. David Douglas, Bushmills, Ireland.

**CADOXTON-BARRY.**—For building hotel and stables. Mr. H. T. Thornley, architect, 100 St. Mary Street, Cardiff.

**CARK-IN-CARTMEL.**—March 30.—For building church. Messrs. Austin & Paley, architects, Lancaster.

**CARDIFF.**—For street and sewerage works. Messrs. Jones, Richards & Budgen, 14 Western Mail Chambers, Cardiff.

**CASTLEFORD.**—March 31.—For building schools. Mr. A. Hartley, architect, Carlton Chambers, Castleford.

**CATFORD.**—For building eight houses. Messrs. Philipps & Norfolk, architects, Catford Bridge.

**CHATHAM.**—April 26.—For building town hall and municipal offices. Mr. G. E. Bond, architect, High Street, Rochester.

**CHATHAM.**—March 27.—For making roads and drainage works. Mr. J. W. Nash, High Street, Medway Terrace, Rochester.

**CLAYTON-LE-MOORS.**—March 27.—For supplying road materials. Mr. A. Dodgson, surveyor, Clayton-le-Moors.

**CLEISH.**—March 27.—For alterations and additions to church. Messrs. Hardy & Wight, architects, 74 George Street, Edinburgh.

**COCKERMOUTH.**—April 3.—For repairing roads. Mr. Wilson, surveyor, Cockermouth.

**COCKFIELD.**—March 27.—For additions to schools. Mr. Weedop, National School, Cockfield, Durham.

**CONSETT.**—March 30.—For building eight dwelling-houses. The Consett Industrial and Provident Society, Limited, Gibson Street, Consett, Durham.

**CORK.**—March 29.—For supplying and delivering cast-iron pipes and special castings. Mr. H. A. Cutler, Municipal Buildings, Cork.

**CORK.**—April 3.—For alterations and additions to warehouse. Mr. Robert Walker, South Mall, Cork.

**DOVER.**—March 30.—For building car-shed. Mr. H. E. Stilgoe, Town Hall, Dover.

**DOVERHAY.**—April 3.—For laying drains, &c. Messrs. Ponsford, Joyce & Davis, 24 The Avenue, Minehead.

**DRIFHLINGTON.**—March 31.—For building schools. Mr. W. Hanstock, architect, Branch Road, Batley.

**DULLERTON.**—March 27.—For building gate lodge. Mr. W. E. Pinkerton, architect, 8 Diamond, Derry.

**EARLSHEATON.**—March 31.—For building retaining wall. Mr. H. Scott, surveyor, Town Street, Earlsheaton, York.

**EASINGTON.**—April 7.—For supplying and fixing hot-water heating apparatus. Mr. G. Phalp, surveyor, Haswell *viâ* Sunderland.

**EAST SHEEN.**—For laying roads and sewers. Mr. F. H. Harvey, 183 Lavender Hill, S.W.

**EDINBURGH.**—April 3.—For constructing reservoir. Mr. James Wilson, 72A George Street, Edinburgh.

**EPSOM.**—March 30.—For building laundry and engine-house. Mr. H. D. Searles Wood, architect, 157 Wool Exchange, London.

**FARNHAM.**—March 31.—For alterations to workhouse. Mr. S. Stapley, architect, West Street, Farnham.

**FLEET.**—March 27.—For restoration of roof of nave and north and south aisle roofs of Fleet Church. Mr. W. M. Fawcett, architect, 1 Silver Street, Cambridge.

FOCHRIW.—March 31.—For building dwelling-house. Mr. Lewis Evans, Penybank, Fochriw, Wales.

GLOUCESTER.—March 27.—For laying sewers. Mr. J. F. Trew, County Chambers, Gloucester.

GRADE.—April 3.—For building cattle and root-house. Mr. W. Rowe, St. Ruan Farm, Grade, Cornwall.

GREENOCK.—April 12.—For constructing outfall sewer. Town Clerk, Municipal Buildings, Greenock.

GREENWICH.—April 3.—For supplying porcelain baths. Mr. A. Budds, Public Baths, Greenwich, S.E.

GRUNDISBURGH.—For rebenching chapel. Pastor H. D. Tooke, Grundisburgh, Suffolk.

GUILDFORD.—April 5.—For supplying and fixing turbine plant and power pump. Mr. C. H. Adams, Water Office, Guildford.

HALIFAX.—April 3.—For building engine-house. Mr. W. Clement Williams, architect, 29 Southgate, Halifax.

HARROGATE.—March 31.—For constructing pipe sewers. Messrs. Martin & Fenwick, 1 Park Place, Leeds.

HAVERFORDWEST.—March 31.—For building classroom. Mr. A. H. Thomas, architect, Haverfordwest.

HEADINGLEY.—For building billiard-room. Messrs. Isitt, Adkin & Hill, architects, Prudential Buildings, Bradford.

HEBDEN BRIDGE.—April 5.—For building Catholic institute, assembly-hall, &c. Mr. W. Wrigley, architect, Crossley Terrace, Hebdens Bridge.

HEYBRIDGE BASIN.—April 6.—For building two pairs of cottages. Mr. P. M. Beaumont, Maldon, Essex.

HORNSEY.—March 28.—For making-up and sewerage roads. Mr. E. J. Lovegrove, Southwood Lane, Highgate, N.

HORNSEY.—March 29.—For constructing stoneware pipe sewers. Mr. E. J. Lovegrove, Southwood Lane, Highgate, N.

HOUNSLOW.—April 5.—For making-up and sewerage roads. Mr. W. A. Davies, Town Hall, Hounslow.

HULL.—March 31.—For building junior department for school and supplying furniture for same. Mr. W. Botterill, architect, 23 Parliament Street, Hull.

IPSWICH.—April 13.—For alterations and additions to Tower House, for the School Board. Mr. J. S. Corder, architect, Tower Street, Ipswich.

IRELAND.—March 27.—For building residence at Kinitty. Mr. James Kennedy, Parsonstown, Ireland.

KILBURN.—April 1.—For building greenhouse. Mr. Henry Cecil, Vestry Hall, Harrow Road, W.

KING'S LYNN.—April 5.—For constructing covered service reservoir. Mr. E. J. Silcock, borough engineer, King's Lynn.

KINGSTON-UPON-THAMES.—March 31.—For making roads. Mr. H. A. Winsor, Clattern House, Kingston-upon-Thames.

KNARESBOROUGH.—For alterations and additions to infirmary, and for road-making and drainage. Mr. A. A. Gibson, architect, 8 Cambridge Crescent, Harrogate.

KNOWLTON.—March 27.—For rebuilding hop oast. Mr. W. J. Jennings, architect, St. Margaret's Street, Canterbury.

LAUNCESTON.—March 31.—For building parsonage. Mr. Otho B. Peter, architect, Launceston.

LEADVILLE.—For building houses. Mr. W. Dixon, architect, St. John Street, Newcastle-on-Tyne.

LEEDS.—March 31.—For alterations to hotel. Mr. Thomas Winn, architect, 90 Albion Street, Leeds.

LEEDS.—March 31.—For erecting stone abutments and wing walls for steel bridge. City Engineer, Leeds.

LEEDS.—March 31.—For building steel girder bridge. City Engineer, Town Hall, Leeds.

LEIGH.—April 7.—For supplying and erecting boiler engine and laundry plant. Messrs. Banks, Fairclough & Stephen, architects, Leigh, Lancs.

LERWICK.—April 14.—For constructing waterworks. Mr. A. Sanderson, 72A George Street, Edinburgh.

LLANHILLETH.—April 6.—For building police-station. Mr. William Tanner, county surveyor, Llanhilleth.

LLANWONNO.—April 15.—For rebuilding church. Mr. E. M. Bruce Vivian, architect, Cardiff.

LONDON.—March 31.—For underpinning isolation ward. Metropolitan Asylums Board, Norfolk House, Norfolk Street, W.C.

LONDON.—April 15.—For building casual wards, Harrow Road. Mr. Henry F. Aveling, 289 Harrow Road, W.

MANSFIELD.—April 6.—For making-up streets. Mr. Frank Vallance, Mansfield, Notts.

MANSFIELD.—For building three shops. Mr. A. J. Cursham, solicitor, Mansfield.

MASBOROUGH.—April 2.—For building twenty houses. Mr. J. Platts, architect, High Street, Rotherham.

THE LARGEST & BEST VARIETY OF FANLIGHTS & SASH OPENERS, &c., to suit all requirements, viz. details of work and price, to work by means of the Vertical Screw Rod and Regulator, or Cord.

SPECIALTIES.—Door Springs, Fanlight Openers and Gear, Ventilators, Locks and Furniture, Builders' General Ironmongery, Iron Casements and Frames, Architectural and other Metal Work, &c., &c.

### CITY LUNATIC ASYLUM.

THE visiting committee of the City of London Lunatic Asylum, which is situated at Dartford, in Kent, have submitted to the Corporation of London plans for improvements in the asylum necessitated by the requirements of the Commissioners of Lunacy. The asylum was opened in 1860, having then cost 68,105*l*. A wing for 70 additional female patients was provided in 1874 at a cost of 9,000*l*, and a wing for 35 extra male patients in 1885 at an expense of 5,100*l*. In 1878 a detached cottage hospital was built at a cost of 5,100*l*. Later on the estate of the asylum was extended by the acquisition of additional land costing 8,000*l*. Though these additions have been made, no improvement of an important nature has been carried out since the asylum was erected, and so far as it affords facilities for the treatment of patients, it stands in a very little advanced position now than then. During the last fifteen years vast strides have been made in the system of the housing and curative treatment of the insane, and recently local authorities throughout the kingdom have been spending large sums in making better provision for them. As a result the committee's attention had been forcibly drawn by the Lunacy Commissioners to the inadequacy of the present buildings. They now recommend certain improvements at a cost of 46,770*l*, of which 16,225*l*. is for a new laundry, 16,300*l*. for infirmaries, 3,075*l*. for baths, 8,700*l*. for a new chapel and recreation room, beside other items. It is not intended to proceed with the whole of the works at once, but to distribute the expenditure over a period of three to five years, the Corporation granting the funds.

## THE BUILDING TRADES EXHIBITION AT THE AGRICULTURAL HALL.

THE exhibition, which was duly opened on Saturday last by the Lord Mayor, who, accompanied by the Lady Mayoress, assiduously visited every exhibit, with many of which he showed himself much interested and pleased, and consented to be photographed as the centre of more than one group, and generally gave the "show" a good "send off," has now nearly run its allotted course, and exhibitors are unanimous in expressing the opinion that it is the best Building Trades Exhibition which has ever been held. Almost every one has booked some good orders, while the inquiries which "may lead to business" are simply innumerable. We continue the description of the principal exhibits which we commenced last week.

*Waller's Grip-fast Tile Company.*

At the stand of Waller's Grip-fast Tile Company a very pretty building has been erected, which shows to great advantage this new patent tile which has been invented by Mr. W. A. C. Waller. These cement-tiles are very largely used upon the Continent, and there is no reason why they should not be just as extensively adopted in this country. One of the great advantages of the use of Waller's patent tile is that in consequence of the shapes in which they are made they are so fixed that they completely lock into one another, they can be made in any colour, and in consequence a very pleasing effect is easily obtainable. The company are supplying at the present time nine varieties of shape. Undoubtedly the most important feature of Waller's tile is that owing to this arrangement, by which each tile is locked to its neighbour, it is simply impossible for rain or snow, however severe, to penetrate. Works have been taken at Erith, Kent, and the company are now prepared to supply the building trades without delay. We shall shortly

give some illustrations showing the various patterns to those of our readers who may not have been able to visit the exhibit at the Agricultural Hall. On Saturday last when the Lord Mayor and Council opened the exhibition they were photographed at this stand, and the effect is exceedingly good, for not only were excellent likenesses obtained, but the roofing is seen to be very excellent from an architectural point of view.

*The Mural Decoration Company.*

During the run of the Exhibition one of the principal features has been the exhibit of the Mural Decoration Company, which has met with great commendation. We have been asked to publish the fact that they have received instructions to repair and match the ceiling of Grimsthorpe Castle, the Lincolnshire seat of the Right Hon. the Earl of Ancaster. This is a very fine old ceiling designed by Sir John Vanbrugh, some 200 years old, and it speaks well for the quality and design of the patent plaster decoration of this firm that such an important commission should be placed in their hands by Mr. Thos. Athey, the earl's architect.

*Aspinall's Enamel.*

The attractive little maisonette which has been a source of attraction at many exhibitions obtains a large share of attention owing to its bright picturesqueness and the facility it affords for the effective display of the various applications to which the firm's world-renowned enamel lends itself. The building itself, as well as the chairs, tables, overmantels, &c., which it contains, are coated with the enamel in various bright, but at the same time delicate, shades of colour. "Wapicti," the new washable distemper, is also used with admirable effect. The specialty, however, to which the firm is now particularly desirous of directing attention is the "O" quality of enamel specially prepared for decorators' use. It has a brilliant gloss, and is made to work easy and flow under the brush. It is usually supplied in a pure white, but can be tinted if desired, or can be made to match any pattern.

*The Enamelled Metal Decoration Company.*

The pavilion erected by this company is effectively decorated inside and out with their patent "Emdeca," an embossed and enamelled metal ornamentation, which has the appearance of tiles, than which it is much lighter and less expensive, and it can, moreover, be fixed in positions where tiles could not be used; a notable feature of the decoration of the pavilion is a panel about 4 feet by 3 feet with a view of Windsor Castle in

Designs by Leading Artists.  
Absolutely Unflammable.

No. 1034. FRIEZE, 26 inches x 37 inches. 6s. 6d. per Panel. Weight only about 1½ lbs.

Prices and Particulars on Application to West-End Depot—158-160 CHARING CROSS ROAD, W.C.

CHIEF OFFICES—DOCK HOUSE, BILLITER STREET, E.C.

ALSO AT MANCHESTER, NEWCASTLE, LIVERPOOL, HULL, CARDIFF, GLASGOW, BRISTOL, &amp;c. &amp;c.

blue, in imitation of old delft, the effect of which it admirably reproduces. It is suitable for hotels, restaurants, hospitals, shops, kitchens, lavatories, bathrooms, halls, &c., makes a capital ceiling for bars or other places where there is much gas, as it can be easily cleaned. Soft soap and water are sufficient to remove any stains, and to make the material shine like porcelain.

*Messenger & Co.*

The only display of horticultural apparatus is that of Messrs. Messenger, of Loughborough, whose glass-houses form an attractive feature in the building. About the houses themselves we did not notice any startling novelty, but in some cases their fittings deserve careful consideration. Their new ventilating gear, for instance, will be found of great value. It is not only suitable for green-houses and horticultural buildings generally, but hospitals, schools, public buildings, churches, &c., can be fitted with lever and other mechanical appliances, by which a single light or long ranges of continuous ventilators in any position can be opened simultaneously with ease. Messrs. Messenger are also showing a new method of heating, by means of which the sunk furnace pit is dispensed with, and their new iron sills, which are much cleaner and more durable than the old wood ones and no more expensive.

*Frederick Walton & Co., Limited.*

This firm have evolved an attractive little show out of the somewhat confined space at their disposal, and manage to find room to display some of their newest patterns and decorations with all the taste that we should look for from them. We are pleased to see that they are putting their goods—the substantial merits of which are too well known to be any further insisted upon—on the market at prices which place them within the reach of everybody who values an artistic and sanitary surrounding. Their ceiling design, No. 1,080, for instance, is a good, distinct, clearly-moulded and graceful pattern, which they are offering at 1s. per lineal yard. Their table-mats, too, the designs for which are by Lewis F. Day and other artists of repute, and which are in sets of six, from 9 by 6 inches to 14½ by 10½ inches, are sold at 2s. 6d. and 3s. 6d. per set.

*J. Mitchell & Co.*

A monumental display of sanitary appliances is arranged with considerable effect by this well-known firm, whose show of lavatories (single and in ranges), sinks, washtubs (also single and in ranges), urinals and w.c.'s comprise some excellent patterns and not a few novelties. Among the w.c.'s the place

*d'honneur* is occupied by the "Grecian," which conspicuously heads the exhibit, and claims attention by reason of its classic appearance and the grace of its lines and ornamentation. The design is pleasing in itself, and will lend itself to almost any scheme of colouring and harmonise with the most æsthetic style of decoration.

*Incandescent Gas Light Co.*

Conspicuously placed in the centre of the building is the stand of the Incandescent Gas Light Co., who, in addition to the ordinary types of burners which they have exhibited at previous exhibitions, are showing two novelties called respectively the "Gem" and the "Switch-light" burners. The former of these can be used with advantage where a less powerful illuminant than the "C" burner is required, and the very small amount of gas consumed, viz. 1½ cubic feet per hour, renders it the most economical form of light to be obtained; while the latter is made for use in large halls and other buildings where it is found necessary or convenient to turn the lights on and off from one point without having to use a torch or other method of lighting. Several novelties in fittings and globes are also shown, and among the latter some small ones of French design and manufacture are especially pleasing.

*Samuel Wright & Co.*

The exhibits sent by this firm are singularly few, but they amply make up in quality what they lack in quantity, and consist of a section of a highly-enriched ceiling, a portion of a very elaborate cornice, a pillar and capital, all of which are designed and finished with the artistic feeling and finish for which this firm has achieved a reputation.

*The London Hoist and Chain Company.*

This company has provided nothing in the way of novelty for this year's exhibition, and content themselves with exhibiting their hoisting appliances, pulley-blocks, cranes, winches, &c.

*Joseph Kaye & Sons.*

Messrs. Kaye & Sons are showing an elaborate selection of their now well-known locks of various makes and descriptions suitable for house, school, asylum, prison and fire-station doors, sliding doors of all kinds, drawers, desks, cupboards, exit-doors of all kinds, lift-doors, stable and loose box doors, night latches, engaged bolts, automatic bolts for folding doors, fanlight openers, window locks, waggon and cart door fasteners, cabinet locks and latches, fare collecting boxes for tramways, omnibuses, &c.

**HEWETSONS,** ARTISTIC FURNISHERS AND HIGH-CLASS DECORATORS, **TOTTENHAM COURT ROAD, LONDON.**

*Thomas Potterton.*

Mr. Potterton is, as usual, showing his patent range boilers for supplying hot water in large quantities and warming houses throughout, in connection with domestic supply heated by a kitchen of ordinary dimensions. He is also showing his new hot-water thermometer, which should be fixed on the main flow pipe as near the boiler as possible, and exposed to view; it will accurately indicate the temperature of water. The glass bulb of each instrument is immersed in a mercury bath protected by a thin steel tube, so there is little chance of injury. By the intelligent management of a kitchen fire used for a heating or domestic hot-water apparatus, and by regulating the boiler damper in summer so that the water is not heated much above 150 deg., which is hot enough for ordinary domestic purposes, no incrustation will take place. His altitude gauge, which accurately indicates if the cistern supplying the apparatus is full of water and avoids the necessity of going to the cistern to ascertain this, is of obvious utility; and another ingenious idea is his improved safety valve, the spindle of which is made of strong brass tube instead of a solid rod, a small petcock being fixed at the top, so that water can be drawn; if this is done it will indicate that the valve seating is free from incrustation. If water does not issue there is something wrong, and the valve and the pipe to same should be disconnected and examined.

*Yates, Haywood & Co.*

In the same position as at the last exhibition, Messrs. Yates, Haywood & Co. have a noble display of stoves, grates and overmantels in wood and cast-iron. Notable among the latter is a very fine specimen of admirable design and execution; it is of great size both as regards width and height, and although the lines and ornamentation are of an elaborate description, the whole thing is cast in only three pieces and the price is distinctly moderate. The firm is also making a strong point of their patent "Quadrant" kitchen, which while of distinctly attractive appearance, possesses the following advantages, and insures economy in fuel, fixing, use and great durability. It has a self-adjusting lifting fire, can be raised or lowered to any point with one hand. The movable parts do not come in contact with the fire, consequently no wedging or getting out of order is possible. The range fire cheeks and the back boiler can be taken out without disturbing any other part of the kitchen. Over and under-draught ovens can be made with enclosed iron flues requiring no brickwork setting.

Messrs. Yates, Haywood & Co. have for many years enjoyed a reputation for their goods, and their name is sufficient guarantee that any goods supplied by them will be of the best quality and workmanship.

*The National Opalite Glazed Brick and Tile Syndicate.*

The application of opalite as a new material for glazing bricks and wall surfaces is attractively demonstrated at the stand (Bay 20) of the above syndicate, where the inner and outer walls, ceiling, &c., of a bath-room are covered by the new method, which possesses many advantages, one (and by no means the least) of which is that it can be applied to an old or unsightly wall without any difficulty and at comparatively little expense. Others are that the material is imperishable; it does not by exposure to damp, frost, or heat, lose any of its beautiful polished surface, neither does it become patchy. There is a saving of nearly 20 per cent. on ordinary glazed work; it is readily repaired, and at much less cost than other systems of tiling or glazed work. Both old and new brickwork can be glazed; and the advantages of having walls glazed after the brickwork is finished are strongly urged, to secure a close joint and avoid a heavy waste in breakages. It is made in a variety of tints, and for beauty and brilliancy is far in advance of the old glaze. The surface being of a higher polish than ordinary glaze, dirt, &c., will not adhere to anything like the same extent. The reflecting power is far superior to that of any other glazing material; the reflected light is greatly increased, and none of its power is lost by exposure to damp. This advantage will be readily appreciated for subways, passages, basements, &c., where borrowed light is a necessity. For bath-rooms, lavatories, corridors, kitchens, larders, dairies, &c., it is invaluable, as the surface is not affected by moisture; it does not craze like ordinary glaze, and therefore needs no renewing. It has already been extensively applied to public and municipal buildings, hotels, hospitals, institutes, schools, baths, railway stations, and has invariably given great satisfaction.

*W. Gooding.*

Mr. Gooding tells us that he has brought out nothing new lately, as he has enough to do to keep pace with the demand for his patent interchangeable rubber stair treads, of which he is showing samples, and which are pretty generally known. These treads consist of an iron keeper pierced with a number of square-shaped holes, through which blocks of rubber are placed,

##### MACKIE'S PATENT "DEFIANCE" HYDRAULIC WATER-TIGHT FLOOR SPRING AND CHECK.

Size of Plate,  
12 x 8 in.  
Size of Box,  
10 1/2 x 6 x 3 1/2 in.

**906**  
80/-  
With top centre  
and brass shoe any size.

This Floor Spring is suitable for any sized door, and can be regulated to suit any force required.

The box is watertight and weatherproof, a distinct advantage when fixed in Banks, Board Schools, Libraries, and similar places, where the floors are frequently washed down.

It is also sent complete with an outer box to fix into floor, to facilitate the spring being taken out when necessary.

Working Models of these and other Specialties may be seen at our newly-fitted London Showrooms, 57 HOLBORN VIADUCT, E.C.  
Architects and Buyers are respectfully invited to inspect same.

these blocks forming the wearing surface, and affording a perfectly firm footing under all circumstances. They are easily adapted to existing stairs, and can be readily fixed by any man, two or three screws being sufficient to keep them in position. They do not in any way weaken the stairs, but greatly enhance the appearance.

*George Jennings.*

One of the most effective stands in the sanitary section of the exhibition is that of Mr. George Jennings, who has managed to arrange a number of such unornamental items as drain-pipes into quite an attractive display. He is showing stoneware drain-pipes, ditto with Stanford patent joints, Tyndale's patent double seal joint pipes, intercepting traps and grease traps, yard gullies, stoneware wall coping, bonding bricks and air bricks, damp-proof courses, terra-cotta vases, architectural terra-cotta moulding, bricks, facing bricks, building bricks, &c., and making a specialty of his patent "double seal" jointed pipes (Tyndale's patent), which are made of the best selected Dorsetshire clay, an imperishable material, homogeneous in texture and impermeable to water, and afford improved facilities for quick laying, testing and covering in, combined with a perfectly sealed and rigid joint. The method of jointing is a patented improvement upon the principle of the well-known "Stanford joint," in the addition of a deeper and under-cut socket, so that after the pipes have been laid and tested the additional security of a fillet of cement may be added for the purpose of insuring a more perfect and permanent connection. The concentric fitting of the "Stanford joint" also prevents any possibility of obstruction whilst jointing, due to a frill of cement being squeezed up inside the pipes through the socket. As an indication of the quality of the clay of which his pipes are made, Mr. Jennings is showing a large drain-pipe in Dorset clay which was laid at Anglesea Barracks, Portsea, twenty-five years ago, and which, having to be removed quite recently in the course of alterations, is seen to be in a condition exactly as new.

*H. J. & C. Major, Limited.*

Messrs. Major have the same stand and position in which we have been accustomed to see them for many past exhibitions, and if they are not showing anything strikingly new, they at least prove that they are not retrogressing in any way. Their *pièces de résistance* are, as before, their patent Roman and angular corrugated roofing tiles which require no mortar or cement, and no counter lathing. They are lighter in weight per square

than slates or Broseley tiles, and for that reason the timber required to support them is less costly. The natural colour of these tiles is a bright, cheerful red; they are also made blue or slate colour by an entirely new process, by which the colouring matter permeates evenly the whole substance of the tile.

*Candy & Co.*

Messrs. Candy have a liberal assortment of white and coloured glazed bricks, salt-glazed bricks, buff granite vitrified stable and other paving bricks, buff vitrified engineering and facing bricks, &c., on show. They are, however, especially drawing attention to their buff vitrified Olympia stable bricks, which are grooved in one direction only, which insures rapid drainage and clean sweeping, two desiderata which are of paramount importance in the domestic economy of the stable. They are likewise extremely hard and heavy, and comparatively inexpensive.

*Linoleum Tile Company.*

The inlaid linoleum tiles manufactured by this company are attractively displayed at Stand 76. They embrace many new patterns and colourings in heraldic, æsthetic, grotesque and other designs, all of which are characterised by the excellence which has brought this company's wares to so high a position in the estimation of the public. Some special patterns and shapes have recently been introduced for the treads and risers of stairs, and when finished with the company's patent indiarubber nosings produce a capital effect, being at once bright, clean, safe, durable and comparatively cheap. The company are bringing out, too, a reversible mat for railway carriages, which is already being taken up by some of the leading railway companies, and will, no doubt, speedily be adopted by all, as in addition to its ornamental appearance, cleanliness and durability, they possess the very appreciable property of deadening to an almost incredible extent the noise inseparable from railway travelling.

*Joseph Arnold.*

The compact little display arranged by Mr. Arnold gives a fair idea of the various products of the valuable sandpits of which Mr. Arnold is the fortunate proprietor. We gave a full description of these phenomenal pits in our issue of March 20, 1896, from which it may not be amiss to reprint the following:—"It is estimated that the yield of sand is from 145,000 yards to half a million yards per acre. The sand, while of a uniformly excellent quality, varies in texture and colour from the pure

## S. B. BOLAS & CO.,

MEDALLISTS, ROYAL PHOTOGRAPHIC SOCIETY,  
Architectural Photographers & Collotype Printers,  
11 LUDGATE HILL AND 3 CREED LANE, E.C.  
PRICE LIST AND ESTIMATES ON APPLICATION:

white silicious sand absolutely free from iron and so fine as to resemble in appearance pounded sugar or table salt (a fine description invaluable for glass making), ranging in colour through all the shades of yellow and grey to a rich orange or dark brown, and in texture to grains the size of shot. A peculiarity of these beds, of which we append a couple of photographic views, is that the different grades of sand are found each in its allotted place, so there is no question of screening the coarse from the fine, each description being ready to hand, a fact which materially minimises labour in the getting, and, with the above-mentioned facilities for carriage, enables Mr. Arnold to put his sand on the market at a lower rate than that which usually obtains. The estate yields every description of sand suitable for building, brick-making, cement-work, filter beds, horticultural and stable purposes, &c. There is also an excellent argillaceous sand for moulding and foundry-work."

*Molesworth & Co.*

Messrs. Molesworth & Co., of Ketton, exhibit at Stand No. 127, Row F, a piece of ashlar with battlement coping, which is much admired, the warmth of colour making it very attractive. There is also a Corinthian capital, balustrades and a pillar of stone 3 feet 6 inches on bed to show depth. The durability of this stone cannot be better exemplified than by the two old date stones on this stand, one dated 1567 the other 1664, in a perfect state of preservation; the arrises of the latter are almost as sharp as when worked. We are also informed the proprietors are now quarrying blocks of immense size, and the quantity seems almost inexhaustible. The stone has a good surface, and from appearances we should say that when once faced it would very soon harden.

*Patent Victoria Stone Company.*

The Patent Victoria Stone Company's exhibit commands attention by reason of its monumental and at the same time very picturesque appearance. Here are shown a mullioned and transomed window in red stone made for the new buildings of the Army, Navy and Auxiliary Forces at Turnham Green; a massive truss for the new buildings in University Street being erected for Messrs. Shoolbred & Co., all the stonework of which is being done in patent Victoria stone; an entrance portico in Victoria stone, which has as good an effect as fine polished granite, for a new hotel at Clacton-on-Sea, and equals plain granite of a very fine texture; a balustrade for new buildings, Whittington Restaurants, Moor Lane, E.C.; a

very handsome example of a staircase for the West Ham Gas Company's new offices; a very fine carved panel by Mabey, which is undoubtedly a work of art, matching yellow Mansfield, and one in red Mansfield; a pair of handsome oval vases in red stone carved by Mabey; specimens of the red and buff tiles used to repave the entrance hall for St. Thomas's Hospital; a fine example of Gothic tracery for the Clerks and Warehousemen's Schools, Purley; some specimens of the platform coping as supplied to the Great Western Railway Company, &c. One is surprised at the beautiful effect that can be obtained by Victoria stone, and all visiting the exhibition should not fail to see this firm's stand. The Patent Victoria Stone Company have taken up the concessions of the Patent Opalite Tile Company for the counties of Nottingham and Leicester.

*Stanley Brothers, Limited.*

The excellence of the productions of this firm are too well known, and specimens have been seen at too many exhibitions to render an extended notice necessary. Their very effective exhibit is as usual built up of their salt glazed and enamelled bricks, blue bricks, roofing tiles, red ridges and finials, red and buff chimney-pots, ornamental red terra-cotta enrichments, semi-encaustic paving tiles, garden tiles, &c., a prominent position being assigned to their Jubilee Panel, of which we had occasion to speak at some length in a recent issue.

*The Grays Chalk Quarries Company.*

At this stand will be found a decorated brick window opening, intended to show the scope of bricks as to variety of colour and work. Bricks (machine and hand-made), reds (dark, medium and light), primrose (dark, medium and light), chocolate, vitreous and primrose hards, specially adapted for reservoirs. Mr. Currey, the secretary of the company, is also showing some special facing bricks in red and yellow, and a special brindle brick for the lining of reservoirs, which is particularly suitable for all engineering purposes. This brick has been used for the South Hants Waterworks Company, also for the South Essex Waterworks Company, in both of which places it has given great satisfaction.

*F. McNeill & Co.*

In our reference to this firm last week we omitted to mention the neat little brochure which the firm has just issued, giving at considerable length the uses of slag wool in building construction, &c., for fireproofing, sound-deadening and insulation of

heat and cold. This little book, which Messrs. McNeill & Co., are issuing gratis, will be found very useful, and should be in the hands of every builder and contractor.

*Matthews & Yates.*

Messrs. Matthews & Yates are showing two of their continuous-current fans, such as they have recently fitted at the Trocadéro and other restaurants, several theatres, &c. One, a 24-inch size, makes 500 revolutions and discharges 3,000 cubic feet of air per minute, while the other, a 48-inch, makes 250 revolutions and discharges 13,000 cubic feet of air in that time.

*Frederick Jones & Co.*

This firm is showing the various purposes to which their silicate cotton or slag wool can be appropriately and advantageously applied. The chief of these are:—For fire-proofing, sound-proofing, or heat-proofing floors, walls, partitions, &c.; for lining roofs of houses, to render them impervious to climatic influences; for protecting iron girders in event of fire; for covering pipes, cisterns and other vessels exposed to extremes of heat or cold; for insulating purposes in cold-air stores, &c. Messrs. Jones & Co. are also showing their wool pipe-protector, the advantage of which lies in the fact that the thick wool lining being made in diagonal sections is intended to be wound round the pipe, and will thus accommodate itself to any bend or angle.

*The Anaglypta Co., Limited.*

Stand 44, Row B, is devoted to the display of the Anaglypta wall and ceiling decorations, the designs for which are all by well-known artists, and embrace a large variety of very excellent patterns both in high and low relief. There is a marked tendency just now for exceptionally high relief, and in recognition of this fact the company have got out some very fine specimens of Old English, Pompeian, English, French and Italian Renaissance, Elizabethan strapwork, "Adams" and Queen Anne, all of which are fully endued with the spirit of the respective periods. The Anaglypta Company are also supplying mouldings to match the different patterns which, in different widths and sizes for all purposes to which mouldings can be applied, have been found particularly useful in ceiling decoration, as by their use the Anaglypta, instead of being run right into the cornice, with which perhaps it does not strictly harmonise, can be cut according to the pattern, leaving a space of greater or less width between it and the cornice, the effect of which is greatly enhanced thereby.

*Cameo Woodworking Company.*

This company have an extensive assortment of samples of their "oppressed" ornamental wood moulds, panels, dadoes, cornices, mantelpieces, architraves, overmantels, chair rails, ceilings, picture rails, picture frames, finger plates, screens. The designs are in relief and in two or more colours, and it is claimed that the patent process adopted for the treatment of the wood (which is the exclusive property of this company)

prevents the burning or crushing of the fibre, and the wood after leaving the machine therefore retains its natural colour and remains perfectly solid. A variety of shades in colour can be supplied, ranging from a very dark brown up to a light biscuit colour. The various designs lend themselves most appropriately to fitting-up steamship or yacht cabins, railway carriages, tram cars, hotel lifts, billiard-rooms, bars, saloons, business premises, bank appointments, &c., and by a judicious arrangement of panels and mouldings can be made to present a rich and attractive appearance at a comparatively trifling outlay.

*Broad & Co.*

Messrs. Broad & Co., Limited, Paddington, exhibit a large variety of white enamelled ware in channel pipes and bends, gully and grease traps, sewer-gas interceptors, and other drainage accessories, with all improvements up to date. This company is also exhibiting an excellent "impermeable" drain pipe, and also channel pipes, bends and gully traps manufactured of cream Bristol ware; these goods being quite impervious need no testing. Broad & Co.'s patent sink is one likely to be very largely used, as it obviates some of the objections to the ordinary scullery sink. The white enamelled drinking-water cistern exhibited is obviously perfectly adapted for the purpose, whilst the sewer-gas interceptors are now so well known as to need no comment. At this stand will be seen excellent patterns of fireclay closets, especially an "infantile closet" designed for schools; also manhole covers, drain pipes, and a selection of sanitary specialties for which the company is so well known. Some excellent specimens of terra-cotta are also exhibited, the buff being especially good.

*Adamant Company, Limited.*

The Adamant Company, of London and Birmingham, have a very handsome exhibit at their stand, which shows off to great advantage the merits of their patent composition; amongst some of the advantages of adamant we may mention the following claims. It is extremely quick setting and drying, and finishes with a very hard, firm, smooth face, and the small quantity of water required to mix the material is of great advantage, inasmuch as the plastering does not affect the wood work, as is the case in lime and sand plastering. The cost is very moderate, and although more than common plastering, gives a job equal to Parian or Keene's at about half the cost. The finer setting coat called Chromolith finishes pure white, and can be left from the trowel, and will take an exceedingly fine polish, and finishing an enamelled white. The special cornice material is also pure white, and all the mouldings run in this material are very hard and clean, and the arrises sharp and fine. The Adamant Company are makers of a special waterproof cement, which can be finished either with a trowelled face or stippled to give a rough cast appearance, and as this can be done in various tints the result is very effective. The company are also makers of special fireproof flooring blocks, which are at present being laid and giving great satis-

faction in several important buildings in the provinces. The blocks are composed of an "adamant" substance, and are made into a concrete with breeze or other like material, strengthening the same longitudinally with wood, iron or steel laths, according to their length and the weight required to be sustained, the said blocks having a length nearly, but not quite, equal to the distance between the bodies or vertical parts of the two girders, and of a breadth about one-third their length. The said blocks may be nearly of a triangular figure in cross section, although the upper surface may for the greater part be flat or curved. The lower surface of the block is flat and made rough for plastering, and the ends of the block have at their lower angles splayed recesses or rebates which, when the block is in position, the lower flange of the girder occupies. The splayed recess or rebate in the end of the block is of such a depth that when in position the lower surface of the said block is at a somewhat lower level than the bottom flange of the girder. Adamant blocks having been put in position on the girders, concrete is placed on the said blocks and girders to a height a little above the top of the girders. The said blocks and top flanges of the girders are embedded in the concrete, the upper surface of which constitutes the floor or the support for other floor finishing. The spaces under the bottom flanges of the girders, between the splayed ends of the "adamant" blocks, are filled in with "adamant" so as to form a foundation for the ceiling below.

*J. Armstrong & Sons.*

Messrs. J. Armstrong & Sons, 95 Dorset Road, Clapham, S.W., Stand No. 17, Row A, have a good display of drain-cleansing and chimney-sweeping machines. They are exhibiting a great improvement in the rods; the brass screws are much longer in the thread and double rivetted. It is, therefore, impossible for the screws to pull off or break from the rod, and they will with this improvement carry up to 400 lengths, or even more.

*Wm. Johnson & Sons.*

This firm of specialists in brick-making and general clay-working machinery, of Castleton Foundry, Armley, Leeds, show, as the chief feature of their exhibit, a new automatic cutting-off table for use in conjunction with plastic brickmaking machines. Hitherto many difficulties have been inseparable

**W. WATSON & SONS, 313 HIGH HOLBORN, LONDON, & 78 SWANSTON STREET, MELBOURNE.**

from the working of automatic tables, and Messrs. Johnson have given their special attention to overcoming these difficulties. The table shown is the outcome of careful study and experiments, and it is claimed for it that it is absolutely positive in its action, and that the simplicity of its design and the strength of its working parts make it a matter of impossibility for the table to fail in its action. This table is shown in conjunction with the No. 3 combination pugmill brick and tile making machine, fitted with crushing rollers, adapted for dealing with an ordinary plastic clay, and producing bricks at the rate of 10,000 and upwards per day.

An exhibit by Messrs. Johnson which appeals principally to makers of sand-faced pressed bricks is the hand-screw sand press, the moulds of which open and close, thereby avoiding all friction on the sides of the brick, and insuring the sand being evenly pressed into all sides of the brick. Some splendid samples of bricks finished on this machine are on view. In this machine, which is largely used by manufacturers supplying the London market for bricks, the improvement is in its simplicity of design and consequent reduction of the number of working parts, so that wear and tear and the necessity for renewals are nominal. The hand-lever brick press shown is also a most handy implement for brickmakers, and embodies the characteristics of the firm's work, namely, strength and neatness of design. The "Simplex" brick and tile cutting table on view is a decided improvement on the old-fashioned type of "Murray" table, inasmuch as the cross-cut wire and all waste ends are avoided, thereby increasing the productive powers of the machine.

Messrs. Johnson have recently taken up the manufacture of crushing and grinding machinery, and in connection with this department they are exhibiting a new and improved type of stone and ore crusher, the "Dragon" patent. This is in every respect a much simpler machine than the ordinary "Blake" type of machine, and ought to find a ready market with users of this class of machinery.

A "Dragon" patent air-separator is also shown, together with a large assortment of samples of various materials dealt with by this machine, which is adapted for separating the fine powder from the bulk in materials of such varying characters as cement, phosphates, basic slag, borax, cocoa, coffee, ginger and other dry ground materials. Varying degrees of fineness can be obtained in a most simple manner. A model of the patent shaft and fittings used in connection with the "Dragon" grinding mill is also shown.

*Ashton & Green.*

The excellent designs in grates, stoves, mantles and suites, invariably associated with this firm are illustrated by numerous examples attractively displayed in the large wall space which they have *pro tem.* appropriated. While all are excellent none possess any striking novelty to call for special mention. Their "Sine Quâ Non" kitchener is worthy of a line of special commendation. By a simple contrivance for raising or lowering, this range is easily convertible from close to open fire and *vice versa.* The patent ventilator carries away all smell of cooking. A patent baffle is fitted under the open fire hood to regulate the draught, to prevent smoke, and to enable a saucepan or kettle to be boiled on the top of the hood. By a special arrangement of side flues top or bottom heat is supplied to ovens. The boiler is of the boot or bath pattern, as preferred.

*Joseph Cliff & Sons.*

Messrs. Cliff & Sons' stand attracts attention by means of its well-displayed array of glazed sanitary ware, conspicuous among which are the Imperial porcelain bath and sink. Specimens are also shown of the white glazed urinal closets, white glazed channels, patent socket-jointed pipes, white and coloured glazed bricks, Hall's patent hanging tiles and grip tiles, Shepwood's patent partition bricks and ceiling tiles, Tiltman's patent partition bricks, Adam's patent dove-tailed frog bricks, Shoppee's bricks for arching and vaulting, chimneypots, architectural terra-cotta, glazed brick fireplaces, &c.

*G. & J. Haigh.*

This firm is showing specimens of their fireclay goods in glazed sinks, glazed bricks, sanitary tubes, firebricks, building bricks, &c.

*The Marble (Moreau-Rae) Syndicate.*

The syndicate have on view examples showing the adaptability of their artificial marble to the purposes of staircases, dados, mantlepieces, table-tops, balustrading, columns, vases, fountains, &c., and of a variety of colours and markings in which it can be produced.

*R. Mason.*

At Stand 120, Row F, is exhibited Mason's patent reversible window, which seems a successful attempt to provide a means for safely cleaning windows, but is at the same time more, for it secures the ventilation of a room, effected by means of a screw arrangement fixed on to the lower window-frame, which

works into a socket on the other, and can be tightened up or regulated so as to leave space as desired for the air to pass upward into the room, at the same time safely securing the windows. When tightened up it is perfectly secure and free from rattle. These sashes have been in use at many important public and private buildings, and have given every satisfaction, as is proved by the numerous testimonials and repeat orders. The manufacturer is Mr. R. Mason, Window Works, Hemsworth, Yorks.

#### *The London Mosaic Company.*

This company have a most interesting collection of specimens of their various productions at Stand 86, Row D, including stained-glass mural painting, tile painting, parquet flooring, wood-block flooring, tiling and marble, glass and granite ceramic. The finished designs of several stained-glass windows which they have prepared are beautiful examples of ecclesiastical work, being original in treatment and of great artistic merit. Parquet flooring is exhibited in various patterns, many of which are quite new, and show the same care taken in their treatment that makes the exhibit worthy of the attention of members of the profession. The designs for mosaic pavement of work now in hand are as good as any we have seen, and the whole exhibit reflects great credit on Mr. C. F. Davis, the art director and manager. The address of the firm is the London Mosaic Company, 13 South Wharf, Paddington, London, W.

#### *The Weldon Stone Quarries.*

At Stand No. 139, Row F, Mr. John Rooke, Weldon Grange, Corby, Kettering, has an interesting exhibit of stone from these quarries; in particular, a date stone from Kirby Hall, 4 feet by 2 feet, which was placed in position in the year 1690. It fully proves the weather-resisting properties of this stone, for the edges are now sharp and clean, and bear little or no evidence of centuries of exposure to our trying climate, and certainly none of decay.

Mr. Geo. F. Harris, F.G.S., author of "Granites and our Granite Industry," in his report on Weldon Stone, says:—"Weldon stone is a typical oolite composed of oolite spherules and shell fragments of the more durable form of carbonate of lime bound together by sub-crystalline calcite. By reason of the interpenetration and joining together of a large proportion of the spherules also, the stone is rendered more durable than the majority of oolite building stones, which are dependent

alone on the nature of their cementing material for their enduring qualities. From the general microstructure of the Weldon freestone, I am of opinion that it is very suitable to withstand the corrosive effects of the acids in the atmosphere of large cities as well as in the country." This stone is an easy and cheap stone to work, as it saws readily without water, is durable, and hardens under exposure, and that it resists frost and water is proved by the above example. These quarries have recently been reopened on a large scale, and the stone has been used at the University Library, Cambridge; Eton College; Chapter-house, Lincoln Cathedral; Rochester Cathedral; Royal College of Music, and the recently reopened church of St. Saviour's, Southwark.

#### *Wippling's Patent Window Co.*

Three interesting little exhibits are to be found at Stand 15A. The principal exhibit is a patent window of the above firm, to which we have made reference before. This window is a very cheap, simple and effective arrangement, which can be fixed by any carpenter and joiner with very little trouble. The result is that for cleaning purposes or for repairing the window has simply to be brought into the room, without the danger of standing outside, which has been the cause of such a terrible amount of loss of life. At the same stand we notice an entirely novel system for ornamental tiles. In consequence of this invention any architect can have his designs photographed on to the tile, or a photograph of any picture or public building. We shall have a further notice of this later on. One more system of metallic lathing—the latest—known as Dickinson's system, is exhibited at this stand. The prices seem to be particularly low, which will doubtless cause it to meet with favour when put upon the market.

#### *W. H. Martin & Co.*

At Stand 86A, Row D, Messrs. W. H. Martin, Bewlay Cliff Wharf, James Street, Camden Town, have a good exhibit of samples of lime, cement, plaster, sand, &c. The sand and ballast are from the Leighton Buzzard Sand Company, Limited, for whom Messrs. W. H. Martin & Co. are agents, and who are able to effect prompt delivery of any order sent them, their wharf on the Regent's Canal being opposite the Camden goods dépôt. They hold also a large stock of Greaves's blue lias lime, which they deliver in sacks bearing the registered trade-mark of Messrs. Greaves, Bull & Lakin, thus insuring the genuineness of the article; also of the celebrated Kentish and

PATENT CISTERN FILTERS, Charged Solely with Animal Charcoal. Requiring, when once fixed, NO attention whatever, and superior to any others. *Vide* Professor Frankland's Reports to the Registrar-General, July 1866, November 1867, and May 1870. *The Lancet*, January 12, 1867.

Also, Testimonials from Dr. Hassall, September 28, 1868; the late Dr. Letheby, February 15, 1868, and December 1873.

Price, £1 10s. and upwards. Portable Filters on this System, £1 5s. to £3.

Patronised and used by Her Majesty the Queen at Osborne, by H.R.H. the Prince of Wales at Sandringham, by H.R.H. the Duke of Edinburgh at Eastwell, by H.R.H. the Duke of Connaught at Bagshot Park, by H.R.H. the Duke of Cambridge, the *élite* of the Medical Profession, and at the London, Middlesex, St. George's, St. Mary's, Consumption, Fever, and German Hospitals, and various Lunatic Asylums, Institutions, Breweries, &c., and at all the Schools established by the School Board for London. Pocket Filters, 1s. 6d. and 9s. each. Household and Fancy Filters, from 10s. Water-testing Apparatus for detecting impurities in Water 10s. 6d. and 12s. each.

157 STRAND, W.C. (Four Doors from Somerset House), LONDON.

Bedfordshire limes, Medway Portland selenitic and heavy Warwickshire Portland cements, and Roman, Keene's and other plasters, bricks, slates, chimney-pots, fire goods, tiles and sanitary goods.

T. S. Pulfora.

Stand 121 is a *multum in parvo* of decorative pigments. Mr. Pulford's colours ground in oil have achieved a deserved reputation. One of his specialties is his damp-wall paint, which forms a complete coating, and is impervious to moisture; it effectually resists atmospheric action. Other specialties are his ultramarine blues, his vermillionette, gold paint, &c. We are told that Mr. Pulford's is the only paint which has received the official approval of the New South Wales Government.

Randall Bros.

Messrs. Randall Bros. (also known as the Copal Varnish Company), while showing a goodly assortment of enamels and varnishes and specimens of work treated with them, do not profess to have brought any novelty with them this year, preferring to rely on their Paris white japan, which they recommend as specially adapted to the decoration of walls, ceilings and doors of bath-rooms, bedrooms, drawing-rooms, hospital wards, schools, breweries, lavatories, ship's cabins, &c.

C. G. Picking.

Mr. Picking, whose stand is generally noticeable for its businesslike substantiality of appearance, has brightened it up this year by adding an extensive assortment of useful and ornamental objects in terra-cotta, for the manufacture of which, by the way, his Bound's Green clay is singularly suitable to his more important if, to a superficial less attractive, show of fireproof building specialties. These latter consist of his well-known and largely-specified interlocking twin-arch tiles, resting between two steel joists and formed so as to completely encase the underside thereof, and having special dovetailed grooves jagged to receive the plaster. A special feature of this system is that each tile interlocks with that adjacent to it on either side, thereby adding to its strength. The whole is covered with concrete, making a homogeneous mass. Picking's fireproof and sound-proof par-

tioning consists of interlocking tiles 2½ inches in thickness. Plain, glazed on one side, or glazed on both sides are also shown, built up so that the neatness of the joints, facility of handling, and generally satisfactory results may be fully appreciated. They make admirable partitions, being hard, clean and sound-proof, while their cost is, comparatively speaking, phenomenally small.

Maurice's Porcelaine Company.

Messrs. Maurice's Porcelaine Company have two exhibits facing each other, and each equally attractive in its particular way by reason of its bright colouring and effective arrangement. At one of these Messrs. Maurice are showing their porcelaines, varnishes, varnish stains, liquid gold, brushes, &c., and at the other, which takes the form of a pavilion, the inner and outer walls are decorated with the firm's specialties, thus giving a practical demonstration of their utility and effectiveness. As the various colours were applied to this building since its erection at the exhibition, a fair estimate can be formed of their brilliance and quick-drying qualities.

Potter & Co., Limited.

Potter's patent fireproof floor is effectively shown at Stand 14. For this flooring it is claimed that it is extremely light, weighing only 20 lbs. per superficial foot; is practically sound-proof, the total disconnection of floor and ceiling deadens the passage of sound; is sanitary, affording no room for vermin, dust, or insects; will resist fire for a very protracted period, and is of great strength—the strongest form of concrete is that of an arch. All the materials being in compression, no metal ties are necessary, as in flat concrete floors.

King & Sons.

The honeycomb wine-bin, which is the specialty of this firm, has been sufficiently long known to have established a reputation for practical utility, but it may not be amiss to recount some of the advantages which its makers claim for it. These advantages are numerous and obvious, and among them we may mention its simplicity, cheapness and durability, the great number of bottles that can be stored in a given space and their adaptability to spaces of irregular form and odd corners, ends of passages, &c. Each bottle, having a separate chamber,

is protected from currents of air and sudden changes of temperature, and the breakage of one bottle cannot affect any other. The tubes (little larger than a bottle) can be handed down awkward cellar-stairs down which framed racks would not pass. Being porous, the tubes will absorb water sprinkled over them, and the evaporation that ensues will materially reduce the temperature, so that where wines and aerated waters are required to be kept cool the patent "honeycomb" wine-bin becomes a simple and ready form of refrigerator when so treated.

*S. & E. Collier.*

Messrs. Collier have, as usual, a diversified collection of their manufactures, comprising their ornamental tiles for vertical tiling, the designs for which are in most cases of high excellence—eaves tiles, gable tiles, hip and valley tiles, plain and ornamental angle tiles, &c. Their specialty just now, however, is their hand-made patent rough-faced and sand-faced tiles, with nibs or holes, for which it is claimed that they will weather with extreme rapidity and "vegetate" freely. Messrs. Collier are also showing specimens of balustrades, mouldings, &c., and Fletcher's patent vacuum chimney-pot.

*M. T. Medway.*

Mr. Medway's exhibit is not a large one, nor is he showing any novelty, contenting himself with specimens of his hand and dinner lifts, hydraulic gears, &c.

*J. C. Broadbent & Co.*

This firm exhibit, as usual, their model of building, showing various methods of applying silicate cotton or slag wool, along with samples and patterns showing application of silicate cotton or slag wool in detail for building and other purposes.

*John P. White.*

A goodly array of wood chimneypieces is on view at Stand 62, where Mr. White has specimens, some of which are remarkable for their quaint and artistic qualities. This, however, is not surprising, as they are the conceptions of such well-known designers as James S. Cooper, George Jack, W. R. Lethaby, G. Le Moins, C. H. B. Quennell, C. F. A. Voysey, and others of equal renown.

*Paragon Patent Glazing and Roofing Company.*

We have already on more than one occasion had occasion to draw our readers' attention to the admirable system of glazing which is the *raison d'être* of this company. Everyone knows the trouble and expense involved in the periodical painting, repairing, and renewing of ordinary glass roofs. In this system the substitution of a very simple locking internal fastening for the bolts, screws, and other intricate internal and external fastenings used in other systems enables builders themselves very easily and very quickly to fix the bars and glass, and also allows inexperienced persons to replace broken glass, and so obviates the expense of calling in a glazier. The absence of outside fastenings prevents the corrosion which results from the action of the atmosphere consequent upon iron being used in contact with zinc or other metals, and also provides the exterior of the roof with a perfectly smooth appearance.

*George J. Farrow.*

Mr. Farrow is again showing his patent improved portable iron scaffold, for which he claims speed in erection, adaptability to the height of any room or building, movability in any direction upon cast wheels, the tyres of which are of india-rubber. It can be made useful as observatories, triumphal arches, fire-brigades, look-out towers, and many other purposes.

*Diespeker & Co.,*

Who inform us in artistically designed letters that they are the only firm in the United Kingdom exclusively engaged in mosaic work, show a large number of very fine specimens of Roman and Venetian marble mosaic for floors, and of Venetian glass mosaic for mural decoration. They also exhibit many designs of floors they have executed, among which we specially noted one in Roman marble mosaic as laid at the National Portrait Gallery for the late Ewan Christian, and another for the Royal College of Music, of which Sir Arthur Blomfield was the architect. The work executed by this firm for H.M. Office of Works is represented at the exhibition by Venetian marble mosaic as laid at the new General Post Office, St. Martin's-le-Grand, and that for H.M. War Office by Venetian marble mosaic as laid at Lydd Camp.

They also show a sample of Venetian marble mosaic which has been adopted by the Metropolitan Asylums Board for their various hospitals, and of which during the last

year they have laid about 12,000 yards at Brook Hospital, Shooters Hill, at the South-Eastern Fever Hospital, the South-Western Fever Hospital, the North-Western Fever Hospital, and the Nursing Home, South Wharf, Rotherhithe. The circular mosaic skirting introduced into these buildings is also shown, and this seems to be a great improvement on the old method of the right angle between the floor and the wall, as the circular skirting prevents any lodging of dirt or water. We are informed that about 10,000 yards of this skirting and of their Venetian marble mosaic is being laid by them at the General Hospital, Birmingham.

There is also a design for the mosaic floor which this firm executed at "Olympia," and over which, according to the turnstile report, far more than 30,000,000 people have passed. We understand that, in spite of this extraordinary traffic, the mosaic does not show any sign of wear, and this seems to give good ground for Messrs. Diespeker & Co.'s offer to guarantee their mosaic for thirty years.

*David & Sant.*

At Stall No. 141 a good display is to be seen of the well-known Forest of Dean stone. As our readers are well aware, this stone has been very extensively used in the South and West of England, and the company are now pushing their trade for the London district. There are three colours—blue, grey and red. One of the principal claims for this stone is that it always retains its colour, and will not turn black from exposure. This sandstone is easily worked, and has a particularly fine finish; it is, therefore, of special service to monumental masons. In consequence of the large number of quarries of which Messrs. David & Sant are owners, they are able to cope with any orders that may be entrusted to them.

*Freeman & Shoosmith's Close-sealed System of House Drainage.*

One of the largest stands is that of Mr. George Freeman, Gordon House, Frederick Place, Brighton, who is exhibiting at Stand 92, Row D, the various patents comprised in the Freeman & Shoosmith system of close-sealed house drainage. The patent sanitary pipe and undrawable joint provides a quicker and easier method of constructing a drain. The pipes are made at the spigot end on the tapering principle with a shoulder and deep grooves. The socket is on the bell-mouthed principle with similar deep grooves inside. When jointed together with cement they form a perfect undrawable joint. They can be laid to a straight line or easy curve without splaying the spigot, or at any gradient.

*The Patent Close-sealed Intercepting Trap.*—By using this intercepting trap better means are provided for making the joint at the nose of the trap, it having a tapering clearing eye. Better facilities are provided for testing the whole of the joints of the drain. The drain testers or plugs can be fixed in the trap itself. Having a separate arm on each side of the trap at angles of 30 and 45 respectively, right and left handed, it is immaterial which side of the trap the fresh air inlet or gully for area water has to be placed. The whole of the drain with the fresh-air inlet, branches, soil pipes and exhaust ventilators can be tested at the same time. After the drain has been tested the stoppers can be put on and a small joint or layer of ordinary fine mortar laid on the same, and afterwards a thin layer of gauged cement. This immediately forms the close-sealed arrangement to the interceptor and drain.

*The Patent Reversible Yard Sink or Gully Trap.*—By using this trap better means are provided for making the joint at the outlet of the gully, the nose of the gully being longer and further out from the body of the gully. Also, by having an oval opening on the nose, should the drain at any time become choked, the stoneware stopper can be taken out and the branch of the drain cleared by means of a rod or cane being used instead of having to break open the drain. Having an oval opening on the nose of the trap, better facilities are provided for clearing out the surplus cement from inside the pipe, thereby doing away with the danger of its becoming choked by having the burrow of cement left in, which cannot at the present time be got at with the ordinary gully now in the market.

*The Patent Water Seal Gauge.*—This invention provides means for testing the water seal of closet traps, gullies or yard sinks and sewer-gas interceptors. It is most essential that the above-mentioned traps, &c., should have sufficient water seal to prevent the escape of the dangerous sewer gases. This invention supplies a long-felt want for some accurate means of testing the said water seal, and by its use the exact depth of seal can be obtained without the disagreeable practice of passing the hand into the soiled trap, &c.

We shall in a future issue refer at greater length to this firm's exhibit.

*H. & F. Bonten.*

This firm have a remarkably fine exhibit of plain and wrought rolled iron ornamental architectural mouldings, to which the attention of architects should be carefully extended, as it is quite

a new departure in iron decoration which lends itself admirably to a style of architecture which is coming increasingly into vogue. Among the plain sections shown are small and light angles, channels, T and Z half-round, oval, and triangle. It is, however, in the ornamental department that this firm claims pre-eminence, and the designs shown certainly justify the claim in a very high degree. Among these are mouldings, garden and entrance-gates, railings, handrails, pillars, balconies, staircases, verandahs, &c. Of special importance where excellence predominates are the self-contained sections for the construction of shop-front windows with roller-blind channels attached, and by an ingenious introduction of ornamental iron mouldings the glazing frame is effected, thereby offering a wrought-iron window at once fireproof, ornamental and inexpensive.

*Greaves, Bull & Lakin.*

Messrs. Greaves, Bull & Lakin have a comprehensive exhibit of their well-known lime and cements, and the purposes to which they can be applied. The quality of the cement is shown by various briquettes, which demonstrate its hydraulicity, high-cementing powers and perfect impervious joint. They show a sample which was found adhering to the Greathead shield after being driven through the Blackwell Tunnel, in the construction of which Greaves' cement was exclusively used as a grout, entirely preventing the inroad of water from the Thames, and a piece of concrete which, after being thirty years in the Metropolitan Railway arch, was subsequently exposed for eight years to the deleterious effects of the London atmosphere. A sample of stone from Wilmcote Quarries, sawn, rubbed and tooled for tennis-courts, &c., is also shown.

*Val de Travers Asphalte Paving Company, Limited.*

This company have on their stand No. 15, Row A, a very interesting display of their asphalte showing its application for various purposes, and also specimens of asphalte and concrete taken from Cheapside after many years' wear, which proves its lasting qualities.

*The Arragon Joinery Company.*

At Stand No. 123, Row 7, the Arragon Joinery Company, 2 Walbrook, E.C., have a very good display of square and round turned joinery and mouldings, the cost of which is less than Swedish joinery. They also exhibit the L.O.O. safety window-cleaner, by which both sides of a window are cleaned simultaneously and by one action, without opening the sashes more than 3 inches. It is light, simple and strong, and no alteration to existing window-fittings is necessary.

*Ratner Safe Company.*

At Stand No. 16 the Ratner Safe Company are showing a various collection of their fire and thief-proof safes and strong-room doors; they have recently supplied among others the following well-known firms:—The Army and Navy Stores, Messrs. D. H. Evans & Co., Peter Robinson and the Incandescent Gaslight Company.

*Chas. Pay Roberts.*

At Stand No. 18 Mr. Roberts is showing his well-known system for the separation and cleansing of rain-water. We have so often referred and spoken highly of this system that it is hardly possible to add any more. The best proof of the value of Mr. Roberts's patent is the extent to which his business has grown.

*Pilkington's Tile and Pottery Company.*

The tiles shown in this exhibit comprise some remarkably fine specimens, notable among which is No. 6, a very effective tile designed by Louis F. Day, and specially suitable for panels and over walling. Nos. 4 and 13, in artistic shades of blue and green, by Voysey, are very fine examples. There are also some very pleasing specimens of their cloisonné tiles, the specialty about which is that the design having raised outlines, the colours are effectually confined within their prescribed limits, which keeps the design sharp, and obviates the blurred edges which in ordinary embossed tiles too frequently mars their effect. In addition to these specialties, they are showing a large variety of tiles suitable for all purposes for which tiles can be used, such as borders, pilasters, friezes, dados, hearths, fender curbs, briquettes, &c., and we must not forget to mention figure panels in low relief, which are excellent in design and colouring.

*Charteris & Longley.*

This firm, located at Stand 112, which is devoted to the exhibition of their patent perfected wood-block flooring and high-class parquetry. The designs are alike numerous and excellent, and the woods employed in the manufacture leave nothing to desire either in colour or texture. Messrs. C. & L.'s perfected system does not depend on any auxiliary for its efficiency—each block is complete in itself. The tongue at each end of block fits into the rabbeted dovetail at side of other blocks, binding

them together in such a manner as to make it impossible for a block to work up, and laid with their special mastic composition, which is specially prepared to stand high temperature; the result is a floor firm and immovable. It is as easy to lay as the old-fashioned square-ended block, and there being no loose screws or dowels, there is no fear of these being left out by careless workmen. The all-important matter of drying the timber is effected by Shapland's patent system, which is a natural process, in which the temperature is never above 80 deg. Fahr. The cells are gently exhausted of the pyro-ligneous acid and other moisture, which is conveyed to the outer air—there is no condensation, and consequently the wood is never sodden and there is no discolouration. They are manufactured by special machinery at works at Peckham and Crawley. This system has been largely adopted.

#### *Mansaque & Co.*

Messrs. Mansaque are showing some very fine specimens of their Moorish tiles, a most effective form of decoration, of which we had occasion to speak in connection with the opening of the new entrance (in Charing Cross Road) to the Alhambra, where the mural decoration was so effectively carried out by this firm. The designs here, as there, are exact copies of those which may be seen in the Alhambra at Granada, the Alcazar at Seville and the Mosque at Cordoba. These tiles are eminently suitable in large places of entertainment, such as theatres, music and public halls, hotels, &c., and wherever durability, richness of colour and brightness are desirable, marvellous effect being obtained from their sparkle and lustre, and they only need to be better known to be widely appreciated by architects and all interested in such matters.

#### *George Wragge.*

In a well-arranged exhibit in the centre of the building Mr. Wragge is showing some fine specimens of metal-work, among which may be enumerated a strikingly handsome wrought-iron baldachino for St. Catharine's Church, Burnley, Lancashire; wrought-iron gates for the National Bank of England (Leeds branch); wrought-iron gates for Whitefields, Manchester (Lord Derby's estate); wrought-iron and copper sign for the London and Lancashire Insurance Company, wrought-steel sashes and frames, wrought-iron and bronze balusters, panels, railings, &c.; polished coinage metal fittings, finger-plates, &c.; sections (registered) of bronze, steel and wrought-iron for casements. Photographs of finished work in great variety are also shown.

#### *Sutton & Co.*

Messrs. Sutton & Co. are making a specialty of their Sabine's steam floor quarries for drying sheds, for which they claim that they afford the simplest and most economical system of heating drying sheds, as they form a perfect floor in themselves, and are heated by exhaust (or live) steam. The floors are so arranged that the steam can be turned to or from any portion, and the heat can also be regulated to any degree. Proper provision is made for the outlet of the steam and condensed steam in each quarter of the floor. In laying a drying floor with Sabine's patent quarries, the only requirement is that the ground shall be made level, and the quarries are laid on a thin layer of cement or mortar, and jointed with ordinary cement. No mid-feathers or other blocks whatever are required.

#### *S. W. Outram & Co.*

This firm makes its first appearance at the Building Exhibition with an extended range of their patent "Aquarius" closet, which possesses the following strong points:—The outlet is adjustable to any position; the joint is submerged and must be perfectly sound, otherwise the water will reveal the defect; the joint is so simple that an unskilled workman can make it, and when made is actually the strongest part of closet; it affords the easiest possible inspection.

#### *Green & Co.*

Green's patent stoneware channel blocks, also shown, are specially designed for the sectional formation of the floors of manholes and inspection chambers—any combination can be effected, in limited space, with any number of sewers or drains, from any direction. The bottoms of inverts are continuous, with no drops from higher levels to break and disturb the flow of drainage, and the branches are formed in such a way as to direct the drainage into the flow of main channel. The blocks are interchangeable—and may be fixed in any desired position—and the rebated joints enable a solid construction to be effected. May also be had with socketed joints. The blocks, which are right and left handed, are made in our "Silicated Stoneware," and are highly glazed with our "Special Salt-glazed Enamel," and a good deal of space is devoted to Green's patent "stopless" disconnecting and ventilating interceptor, which is specially designed for the easy passage of solids and to utilise the full force of the liquid drainage to scour and clear the trap. These results are obtained by a combination of entirely novel features, viz.:—The peculiar and vary-

ing section of the waterway, the position and extended straight form of tongue, the induced forward action in the rear part of the well, and the easy ascent of the front part. The compacted form of pipe sockets, allowing the trap to be fixed in the least possible room, the sockets and spigots shaped to prevent the formation of burrs in connecting pipes with the trap, and the square base placed diagonally, giving great stability when fixed.

#### *Albion Clay Company.*

The attractive display of this company consists of samples of clays from which the "granitic-stoneware" pipes are made. The company are the sole proprietors of these clays (not fire-clay). By their careful blending without the admixture of any other material a hard, dense, impervious, incorrodible and imperishable stoneware body is made specially adapted for sanitary purposes. It is claimed that the pipes, &c., made from these clays do not "sweat" under pressure. They withstand the severest test, and have been proved equal in every respect to the best quality of "London made" or other pipes made from the Dorset clays.

#### *Mark Gentry.*

Mr. Gentry's pretty little stand is quite a compendium of the wares for the excellence of which the exhibitor is well known, comprising a variety of ornamental panels of various sizes, shapes and designs, grotesque, floral and geometrical, dates, monograms, &c., specimen arch bricks for gauged work—these can be made to any size or specification; a small brick, running five courses to the foot, which is being especially manufactured for the house—Cheveley Park Mansion—which Mr. McCalmont is erecting at Newmarket; fine rubber bricks, both moulded and plain, in light or dark red, and both of excellent colour; mouldings, string-courses and various other varieties of bricks, all of which are remarkably of high quality in texture and colour.

#### *The Eagle Range Company.*

The excellences of the various ranges made by this firm are too well known to need any recapitulation. They are showing some excellent specimens of their various types, but no special novelties; without these, however, their exhibits always manage to interest a large number of visitors, who evidently take a great interest in watching the manipulation of the fires, and listening to the intelligent explanations given by the attendants.

#### *A. & G. Taylor.*

Although making no appreciable show as exhibitors, this firm have come prominently to the front in the course of the exhibition, as they took photographic groups of the opening ceremony and other parties in which the Lord Mayor and Lady Mayoress prominently figured, as well as taking views of nearly all the exhibits, the results of which were in all cases eminently satisfactory and artistic.

Among the other exhibitors whose exhibits lack of space prevents our noticing at greater length are the following:—H. Hart: Drain and chimney-cleansing machines, ranging from 30 feet to 200 feet lengths. Every description of drain and sweeps' tools, brushes, &c. Rigby Battock & Co.: High class painting brushes and artist's tools. Lyte's Metallic Woven Stair Tread Company, Limited: Patent stair treads. David Caldwell Simpson: Revolving window frame made to revolve on pivot, so that the whole of the frame and sashes can be turned completely inside out. L. Told: Model tower made of Dundry freestone, Somersetshire. W. Foster: Bay window and carriage door fitted with Foster's patent spring rack. Thomas Green & Co., Ltd.: "Smithfield" gas-engines, with dynamo and electric installation. Thos. Kemp: Model of improved system of house drainage, patent intercepting traps, showing pipes fitted for use with and without manholes. Durrans's Patent Syndicate: Durrans's "Kallio" metallic jointed airtight cover, "Kallio" self-cleaning galvanized iron cisterns. Wilson & Co.: Patent dioptric pavement lights, patent dripless roof lights, patent safety pavement lights, &c. Cranstone Engineering Works, Limited: Dinner service lift, self-sustaining hand-power warehouse lift, &c. A. E. Parnacott, jun.: Pneumatic water waste preventing flushing cistern (patent applied for). John Knowles & Co.: "Vitrifine" stoneware pipes (with original certificate of a challenge test), patent anti-vap street gully, &c. G. & F. Couzens: Ball trap gully, flap trap gully for preventing the flooding of basements or cellars, tidal wave interceptor, &c. Pease's Tubular Construction Syndicate, Limited: Tubular floor of light trough ironwork and concrete. Bratt, Colbran & Co.: Wood chimney-pieces, stoves, tiles, wrought-iron and other metal work, stained-glass, iron and marble chimney-pieces, kitchen ranges, &c. James G. Tuxford: Small model roof covered with fancy Gothic slates, slate ridge and slate finials; various sample slates, finials and ridges; specimens of slate cleavage, &c.

*Writing Fluid.*

We have just seen samples of this new ink, and are much pleased with it. It flows readily from the pen and is of good colour.

In conclusion, we can heartily congratulate Mr. Montgomery for his production, with the assistance of an exceedingly able Council, of a most interesting and successful exhibition, and trust that in future years the Building Trades Exhibition may be if possible, an even greater success.

**VARIETIES.**

THE Secretary of State for Foreign Affairs has received a despatch from H.M. Consul-General at Christiania, stating that tenders are invited for the delivery to the Municipality of Stavanger of a certain number of gas, water and drain pipes. Tenders for the above must be received at the Stavanger State engineer's office by April 1 next. Such further particulars as have been received may be seen at the Commercial Department of the Foreign Office any day between the hours of 11 A.M. and 6 P.M.

MR. JOHN USHER is the donor of 8,000*l.* towards the foundation of a Chair of Public Health in the University of Edinburgh, by whose liberality, combined with that of the late Mr. A. L. Bruce and members of his family, the Chair is likely to be instituted at an early date.

**TRADE NOTES.**

MESSRS. EASTON, ANDERSON & GOOLDEN, LIMITED, inform us that having disposed of their premises in Whitehall Place, their London address on and after March 25 will be Broad Sanctuary Chambers, Broad Sanctuary, S.W., adjoining the Westminster Palace Hotel.

WE are requested to state that Mr. Smellie, of the firm of Adshead & Smellie, will attend at their stand at the Furniture Exhibition on the opening day, Friday, April 2.

THE new offices for the Cheshire Lines committee, at the Central Station, Manchester, are being warmed and ventilated by means of Shorland's patent Manchester grates, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

MESSRS. STREET & CO., advertising agents, of 30 Cornhill, E.C., and 5 Serle Street, W.C., announce that in consequence of their increasing business and for the convenience of their West End clients, they will open on Monday, April 5, 1897, a branch establishment at 164 Piccadilly, London, W.

**BUILDING AND BUILDERS.**

MR. WILLIAM SHEPHERD has been appointed president of the Central Association of Master Builders of London for the ensuing year, Mr. B. J. Greenwood and Mr. Thomas Gregory vice-presidents, and Mr. Charles Wall treasurer.

THE old Museum buildings, Norwich, are about to be altered into public baths. The tender of Mr. H. C. Greengrass, of Norwich, for 720*l.* has been accepted, as well as the tender of Messrs. Bradford & Co., of Salford, to supply and fix boilers, &c., and hot and cold water supplies and heating apparatus, or 814*l.*

THE Charity Commissioners having approved of the removal of Christ's Hospital to Stammerham, near Horsham, the contract for the foundations has been let to Messrs. Longley, of Crawley. The quantities for the superstructure are being prepared.

A WARDEN'S house is to be erected in connection with the Bermondsey Wesleyan Settlement, at a cost of 2,000*l.*

A PUBLIC library designed by Dr. Rowand Anderson was opened at Thornliebank on Saturday. It is a memorial of the late Mr. Alexander Crum.

THE premises of Messrs. Kirk & Randall, Warren Lane, Woolwich, suffered from a fire on Monday, when part of the roofing was destroyed.

MESSRS. DUPONT & CO.'S tender for construction of a winter garden at Southend, amounting to 5,316*l.*, has been accepted.

A WORKHOUSE is to be erected for the Evesham Union from ans by Mr. G. H. Hunt.

**THE WIDENING OF FLEET STREET.**

ON Tuesday next, the 30th inst., at the Commissioners of Sewers, Mr. Alderman Treloar will move that the necessary notices be served to acquire all interests in all the premises (15 houses) between Ludgate Circus and Salisbury Court, so

ESTABLISHED OVER HALF A CENTURY.

**BILLS OF QUANTITIES, SPECIFICATIONS, CONTRACTS, PLANS,**

LITHOGRAPHED IN BEST STYLE & WITH GREAT EXPEDITION BY

**Partridge & Cooper**

ARCHITECTS' AND SURVEYORS' LITHOGRAPHERS,

191 & 192 FLEET STREET, and 1 & 2 CHANCERY LANE, LONDON, E.C.

LIBERAL DISCOUNTS ACCORDING TO ARRANGEMENTS.

**THE SOUTHAMPTON STEAM JOINERY CO.,  
BELVEDERE WORKS, SOUTHAMPTON.**

London Office: 11 Clement's Inn, Strand, W.C. Estimates supplied.

Manufacturers of JOINERY suitable for all purposes, from the Cottage to the highest class of Mansion and Public Building.

**IN HARD OR SOFT WOODS.**

Church, Bank, Office, Shop, Ship, Yacht and other Fittings. School Seats and Desks. Chimney-pieces. Horticultural Buildings, &c.

MOULDINGS. ELECTRIC LIGHT CABLE CASINGS AND COVERS.

STEAM SAWING, PLANING, AND MOULDING MILLS.

Joinery and Fittings have been manufactured at these Works (which are the largest in the South of England for some of the most important buildings in this Country and Abroad.

FIRE**

**INSURANCE COMPANY,  
LIVERPOOL.**

Liberal Commission allowed to BUILDERS AND ARCHITECTS for introduction of Business. Subscribed Capital, £2,127,500.

**SIR WILLIAM BURNETT & CO.'S**  
Timber Preserving Solution, &c.  
**THE HYDRARCYRUM CUM ZINCO PROCESS**  
(CHURTON'S PATENT, 1895).

For over fifty years the firm of SIR WILLIAM BURNETT & CO have been preparing a solution for the preservation of Timber Felt, Canvas, Rope, Sacks, &c., from dry or wet rot, the attacks of insects, vermin (rats, &c.). Particulars and prices, with testimonials of the Sole London Agents:—

**WILSON & CO., 11 PHILPOT LANE, LONDON, E.C.**

**READING CASES.—A NEW well-made Reading Case**

for "THE ARCHITECT" can be supplied on application to the Publisher, the charge for which is 2*s.* 6*d.*—Address, P. A. GILBERT WOOD, 175 Strand, London, W.C.

that this important improvement may be at once proceeded with. The London County Council has agreed to pay 65,390*l.* towards the cost of this portion of the improvement, and it is hoped that the Commissioners of Sewers will adopt Mr. Alderman Treloar's proposal. The improvement is much needed, and will, when completed, make Fleet Street 60 feet wide, adding 16 feet to the width from Ludgate Circus to Salisbury Court; that is to say, for 320 feet of its length. The entire length of Fleet Street from Temple Bar to Ludgate Circus is 1,670 feet, so that the proposal is to widen at once about one-fifth of the whole length of the street.

### THE TIMBER SUPPLY OF THE BRITISH EMPIRE.

A PAPER was read by Dr. Schlich, professor of forestry at the Royal Indian Engineering College, Coopers Hill, at the Imperial Institute on Monday night on "The Timber Supply of the British Empire." Sir Steuart Colvin Bayley presided. The lecturer said the average annual imports of timber into the several parts of the Empire during the years 1890-94 amounted to 19,135,000*l.*, while the exports averaged 5,114,000*l.*, showing that the net imports into the Empire reached the enormous sum of 14,021,000*l.*, an increase of 2,293,000*l.* in six years, or a mean annual increase of 382,167*l.* The United Kingdom was by far the greatest importing country within the Empire, having taken timber to the amount of 17,595,000*l.* out of the total of 19,135,000*l.* During 1894 the timber imported into Great Britain and Ireland from British Colonies and dependencies was valued at 4,274,484*l.*, and from foreign countries at 14,149,055*l.* By far the larger portion of the timber imported into the United Kingdom came from Russia, Sweden, Norway, Germany, France and the United States, Canada being the only British dependency which at all equalled the export countries on the Baltic. Canada was estimated to contain 1,248,798 square miles of woodlands, but enormous tracts of that area did not contain any useful timber, while the remainder was by no means so well taken care of as it ought to be. Fires were frequent and disastrous, and the quantity of timber thus lost to the colony was calculated to be many times more than that cut down and exported. Notwithstanding those drawbacks, however, he believed that with proper management and careful conservation of the forests, Canada might, at a moderate relative expenditure, supply the whole world for many years to come. He advocated the creation of a forest department in

this country, the careful conservation of existing and the creation of new forests by planting vacant lands, the establishment of schools of forestry and model plantations for the guidance of private owners, and Government grants in aid of those objects.

### PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

#### APPLICATIONS FOR PATENTS.

6060. Archibald Griffin Rider and Edwin Russell, for "Improvements in and relating to sliding sash windows."

6066. The Wilkinson Sword Company, Limited, for "An improvement in door locks."

6113. Frederick Charles Lynde, for "Improvements in flushing cisterns and the like."

6121. Joshua William Taylor, for "Improvements in means for removing steam and vapours from buildings, and for promoting ventilation; applicable also for the prevention of draughts in chimneys."

6129. Thomas Bainbridge, for "The ladder grip and scaffold rest."

6138. James Hart Skinner, for "Improvements in or relating to chimney, ventilating and like cowls."

6191. John Abraham Noel, for "Improvements connected with chimney or ventilator tops."

6224. Edward Taylor, for "Improvements in sash-fasteners."

6242. John Henry Vidal, for "Improvements in the flushing of water-closets."

6310. William Gardiner, for "An improved window fastener."

To INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 73 Chancery Lane, London, W.C.

# THE NEW EXPANDED METAL

*Meshes from  $\frac{1}{4}$ th in. to 6 in. wide. Strands from 24 B.W.G. to  $\frac{3}{16}$ th in. thickness of steel.*

**FOR BUILDING CONSTRUCTION**, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

**FOR SOLID PLASTER PARTITIONS**, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

**FOR FIREPROOF LATHING**, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

**FOR CONCRETE FLOORS WITH EXPANDED METAL**.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

**FOR EXTERIOR WALLS OF BUILDINGS**.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

**FOR FENCING, TREE GUARDS, WINDOW GUARDS**, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

**ORNAMENTAL. STRONG. CHEAP.**

**OTHER USES FOR EXPANDED METAL**.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away. Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

**BRASS, ALUMINIUM**, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

**CATALOGUES AND PRICE LISTS** can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

**THE EXPANDED METAL COMPANY, LTD.,**

**39 UPPER THAMES STREET, LONDON, E.C.**

Telegraphic Address, "Distend, London."

Works—WEST HARTLEPOOL.

Telephone No. 1829.

## EDITORIAL NOTICES.

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

## NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

## CONTRACTS OPEN.

ABERDEEN.—April 3.—For improvements on blacksmith's house at Thriepfield, Udney. Messrs. Jenkins & Marr, architects, 16 Bridge Street, Aberdeen.

ABERDEEN.—April 5.—For alterations to dwelling-house at Easter Powlair and new steading of offices at Shannel. Mr. George Cocker, Balnahard, Aboyne.

ACCRINGTON.—April 3.—For alterations to floor and ceiling and supplying cases for museum. Mr. W. J. Newton, Town Hall, Accrington.

ALNWICK.—April 5.—For erection of house and premises at Christon Bank. Mr. George Reavell, jun., architect, Alnwick.

ASHTON-UNDER-LYNE.—April 14.—For constructing embankment, &c., for formation of reservoir. Messrs. G. H. Hill & Sons, 3 Victoria Street, Westminster.

ASHTON-UNDER-LYNE.—For erection of six houses in Nelson Street, Hooley Hill. Mr. J. H. Burton, architect, 2 Guide Lane, Hooley Hill.

AUDENSHAW.—For alterations to St. Stephen's Central Schools. Mr. J. H. Burton, architect, 2 Guide Lane, Hooley Hill.

BALLINAMALLARD.—April 3.—For building school. Rev. George M'Meel, Ballinamallard, Ireland.

BARDON.—April 2.—For main drainage works. Mr. J. B. Everard, 6 Millstone Lane, Leicester.

BARNESLEY.—April 7.—For erection of three houses and outbuildings, Dobie Street. Mr. Herbert Crawshaw, architect, Regent Street, Barnsley.

BATH.—April 12.—For extension of the buildings of the Bath Corporation electric-light works, Dorchester Street. Mr. F. H. Moger, clerk, 3 Wood Street, Bath.

BATLEY.—April 5.—For making-up roads. Mr. O. J. Kirby, Market Place, Batley.

BELFAST.—April 16.—For extensions to shop premises, corner of Bridge Street and High Street. Messrs. J. J. Phillips & Son, architects, 61 Royal Avenue, Belfast.

BIRKENHEAD.—April 7.—For sinking bore-hole. Mr. George Miller, 9 Hamilton Square, Birkenhead.

BRADFORD.—April 5.—For partly rebuilding two warehouses. Messrs. Milnes & France, architects, Bradford.

BRADFORD.—April 9.—For erection of three houses in Corban Street, Wakefield Road. Messrs. Rycroft & Firth, architects, Bank Buildings, Manchester Road, Bradford.

UNEQUALLED FOR

ALL DECORATIVE PURPOSES

Aspinall's

ENAMEL

For Inside and Outside Work.

READY FOR USE.

This Enamel, which has taken the Highest Award wherever exhibited, imparts a rich glossy appearance to all surfaces to which it is applied, and dries with a hard impervious surface as washable as porcelain. It is admirably adapted for use in Hospitals, Public Institutions, Mansions, Private Houses, &c., where sanitary conditions are of the first importance. One gallon will cover about seventy square yards on a non-porous surface, and is equal to about three gallons of mixed paint.

**ASPINALL'S ENAMEL** can be made to any tint, is absolutely non-poisonous, and is unequalled for *all* decorative purposes.

Builders and Decorators should apply for full particulars of our special "DECORATOR'S" ENAMEL.

**ASPINALL'S ENAMEL, LTD., NEW CROSS, LONDON, S.E.**

**BUILDING TRADES EXHIBITION.**

IN our notice of the exhibition last week we inadvertently omitted a reference to the exhibit of the

*Ferrybridge Foundry Company,*

who showed their new "Fryston" kitchener, which certainly deserves a few words of description, as it marks a distinct departure from the ordinary run of cooking stoves, inasmuch as it is at the operator's will a simplex or a duplex stove, and

this is brought about in a very simple manner, as the illustrations show. The top fire, which is all that is required for top heat, grilling, frying, boiling, &c., rests on a movable grate, which can be, at the discretion of the cook, removed from bar to bar or entirely dispensed with. For bottom heat the bottom grate only is required, and on this a shallow fire only is sufficient to produce the required result. Either of these fires will be found sufficient to heat the boiler, the ovens can be used for

baking or roasting, and the economy of fuel is sufficiently obvious, while, when an open fire is required for roasting purposes, it suffices to remove the loose grate, fill up the basket,

and a large fire surface is at once obtained. As regards price, the "Fryston" kitchener compares well with others in the market, and looks like having a big future.

*Walter Gibbs & Sons.*

Messrs. Gibbs & Sons showed some fine samples of brilliant-cutting, French embossing, back-painted mirrors, &c., and a large variety of advertising tablets. A conspicuous feature of this stand was however an embossed or brilliant-cut decoration embracing Gibbs's patent amber staining. It is a combination of white and gold, and is a beautiful form of glass decoration.

*John Grundy.*

Mr. John Grundy was represented by his "Helios" and "Sirius" smoke-consuming grates for chimneypieces, the "Hestia" slow and quick-combustion portable warming and ventilating stoves, the "Calorifer" and the well-known Grundy smoke-consuming central fresh-warmed air-heating apparatus for public buildings and private dwellings.

# IMPORTANT TO ARCHITECTS

**WM. WALLACE & CO.** have special facilities for carrying out Architects'

Designs in the best manner at the lowest possible cost, and invite drawings and specifications for Estimates (free of charge).

151, 152, 153, 154 & 155 CURTAIN ROAD, LONDON, E.C.

*A. J. Ellis.*

Ellis's patent compensation system, as exhibited, is a thoroughly reliable and economical glazing, watertight, and simple to fix. An ordinary workman can fix it, or replace broken glass in a very short time. The sash-bars are of steel, with condense gutters, and are light and strong. The compensating arrangements consist of a spring clip, which presses the zinc caps on the glass. The spring clip is kept in position by a brass bolt, which passes through a round hole in the steel sash-bar. The bolt hole in the zinc cap is oval, thus allowing a slight play on the bolt. The glass and metal is therefore free to expand, and any breakage of glass through a sudden change of temperature is prevented. Ellis's patent steel flooring is composed of rolled steel sections, with fillets on both sides of webs to carry bent plates. The sections are interchangeable and reversible. The flooring is constructed on the girder principle, having thick flanges and thin webs. It is therefore strong and light. The 2-feet by 8-inch sections have  $\frac{3}{4}$ -inch flanges and  $\frac{3}{4}$ -inch webs. This section may be used longitudinally without main girders for road bridges up to 22 feet span. Ballast plates with parapets or handrails may be fixed to outer flanges of troughs. The flooring has been used by railway engineers and county surveyors, and has given great satisfaction.

In the galleries, which were for the most part given over to the purposes of the handicraft competitions, room was found for a fine display of architectural drawings lent by Sir Horace Jones, Henry Hall, F.R.I.B.A., and J. P. Seddon, F.R.I.B.A. Among the works of the former were the fine designs (three in one frame) for the Guildhall Library, showing interior, exterior and museum, others for the Council Chamber, Guildhall School of Music, Leadenhall Market, and Billingsgate, &c. Mr. Hall showed his premiated designs for the Admiralty and War Office, Whitehall, and Mr. J. P. Seddon was represented by his designs for the decoration of Lambeth Chapel; chancel screen, Ingham Church, Norfolk; decoration of St. Paul's; Aberystwith College (several drawings); cartoon designs for the window of Llanbadarn Church, &c., all of which are too well known to need special reference. Mr. Seddon also sent in a collection of his water-colour drawings, consisting principally of landscapes, and a superb chimneypiece in American walnut and mosaic, mosaic panels, &c.

On Saturday evening Sir Arthur Arnold, ex-chairman of the London County Council, accompanied by Lady Arnold, pre-

sented the medals and certificates to the successful competitors in the handicraft competitions at the Building Trades Exhibition at the Agricultural Hall. Professor Banister Fletcher presided, and said that nearly 100 genuine working men had entered the competitions, or 100 per cent. more than competed at the exhibition of 1895. The consultative council of the exhibition were of opinion that, inasmuch as the apprenticeship system was dying out, these competitions, which might be greatly extended in the future, would prove of the greatest value in the technical education of the workmen. That a desire existed for the obtaining of records of merit was shown by the fact that during the evenings of that week the competitors had worked ten hours without any pay. The verdict of the judges was that the work had been done well, but that the competitors were for the most part weak in technical knowledge. Sir Arthur Arnold then distributed the prizes, and, on the motion of Mr. Charles Barry, a vote of thanks was passed to him and Lady Arnold for their attendance. In reply, Sir Arthur Arnold said he had to congratulate the promoters of the exhibition on the unqualified success of their venture. Such success, however, should not be surprising when the fact was borne in mind that the building trade was the largest industry of London, and more artisans were connected with it than with any other trade. With that trade, too, so much of the health and comfort of the people was bound up that it was most important that the workers should be intelligent men with a thorough knowledge of their business. He could imagine no better means of promoting that thorough knowledge than the competitions which had been conducted at that exhibition.

WE have received some particularly fine examples of the Japanese paperhangings supplied by Messrs. C. E. Leopold & Co., 24 Cecil Court, Charing Cross Road. In diversity of design they cover a very wide field, rendering them suitable for all purposes to which a rich form of decoration can be applied, such as theatres and music halls, hotel and public bars, halls and staircases, house-boats, flats, billiard, dining and drawing-rooms, &c. Among the patterns before us, perhaps the most beautiful, certainly the most striking, is a very bold rendering of magnolias and palm trees. This, however, is of great breadth of design, and would be suitable only for the decoration of a very large building; but for covering walls of smaller dimensions an extensive range of styles is offered for choice.

## BUILDING AND BUILDERS.

A CHURCH extension scheme has been started at Plymouth which contemplates the erection of six new churches in the "Three Towns." Two sites have already been given, and it is expected that the remaining four will also be obtained without cost.

THE Great Northern Station Hotel at Leeds is to be closed until July 17 for structural alterations.

THE foundation-stone of the Carnegie Free Library at Wick was recently laid by Mr. Hew Morrison, of the Edinburgh Free Public Library.

THE Primitive Methodist buildings in Great Western Street, Manchester, are to be enlarged by the addition of a new lecture hall and several classrooms.

OXFORD PLACE CHAPEL, Leeds, the largest Wesleyan chapel in the city, is to be reconstructed at a cost of 18,000*l*. The rebuilding includes a synod hall to hold some 600 persons.

A COMMITTEE of Landudno Council will meet Mr. Silcock, the architect for the proposed municipal buildings, in order to have the cost reduced to 12,000*l*.

MEMORIAL-STONES were laid on the 27th ult. of the new Wesleyan Sunday School, Lockwood, in the Huddersfield Buxton Road circuit, which is being erected at a cost of 4,000*l*.

THE new bridge to be erected across the river Ayr, a little eastward of the railway, is to be begun this month. The structure, which is principally of iron, will be a handsome one. The bridge is designed specially to give access to the new show ground in Wallacetown, purchased by the Agricultural Association. It will also connect a new road which is to be formed through Craigie grounds. The bridge will be about

40 feet wide, of three spans (71 yards in length), and will cost a little over 6,000*l*. The approaches, &c., are to cost 1,000*l*. more. The bridge will be finished by the end of the year.

WHILE some men were engaged in pulling down the front wall of the Southampton Gaol, on which was a large representation of the borough arms carved in stone, the wall suddenly collapsed with a loud noise, which resounded through the neighbourhood and created a deal of excitement. A lad in the employ of Mr. Dibben, of St. Mary's Road, who was engaged in picking up bricks to throw into a cart, was knocked down and partly buried in the material which fell. The men who were occupied in pulling down the wall, seeing that it was about to give way, were fortunately able to jump clear and so escaped injury.

## VARIETIES.

A COTTAGE hospital has just been built at Aharacle. It is a commodious building of two storeys and has been furnished with all modern appliances.

A SPACIOUS school which has been erected by the Unitarians of the Britain Hill Church, Heywood, was formally opened on Saturday last. The old school is to be added to the church to increase its size.

THORN Wesleyan Chapel, Bacup, has just been reopened after undergoing improvements which have cost 380*l*. The Rev. J. D. Brash, of Liverpool, was the preacher for the occasion.

IN the course of excavating for some new buildings on the 27th ult. the Chatham Corporation's workmen discovered two skeletons which archaeological experts declare to be those of Romans who were buried about 1,500 years ago.

A VALUABLE collection of pictures, including examples of Landseer, Cox and Moreland, has been lent for exhibition in the reading-room of the Newington Public Library, Walworth Road, by a lady who wishes to remain anonymous.

SIR EDWARD LAWSON has presented to the parish church of Beaconsfield a window in memory of Canon Cholmeley, the late rector. The lights represent his connection with Magdalen College, Oxford, with Lincolnshire, his native county, and with Salisbury, of which he was a prebend.

THE fourth monthly dinner organised by the members of the London Chamber of Commerce will take place on Tuesday next, at 6.15 for 6.30 P.M., at the Trocadero Restaurant, Shaftes-

bury Avenue, W.C. The subject for discussion will be "Art in its Relation to Industry," and Sir James Linton, P.R.I., will take the chair; and amongst those who have promised to attend and speak are Mr. Marcus Stone, Mr. Walter Crane, and Mr. H. S. Mendelssohn.

THE death is announced as having occurred on the 27th ult. of Mr. Thomas Leonard Ellis, ironmaster, Coatbridge, after a brief illness. He was the youngest son of the late Mr. Thomas Ellis, the founder of the North British Ironworks, Coatbridge, one of the largest malleable ironworks in the country. The deceased was a comparatively young man, and was a member of the recently formed limited company that now conducts the works. He leaves a widow and child.

COLINTON Church has recently undergone some internal improvements in the way of reseating, painting, &c. A marble tablet has been erected to the memory of the late R. A. Macfie, of Dregghorn, and another has been placed to the memory of the late Sir James Liston Foulis, Bart., and at the west door a beautiful panel has been placed giving some details of the ancient church of the parish.

FUNDS to be devoted to the purchase of English pictures have been placed at the disposal of the Royal Academy by the Government of one of the Australian colonies. The sum of a thousand a year will be entrusted to the charge of the Forty, under conditions similar to those which govern the Chantry Fund, and the choice of the pictures will be left entirely to the discretion of the President and Council.

THE interior of St. Mary's Roman Catholic Church, Lochee, has been improved by the erection of a very fine altar. Surmounting the altar is a canopy of white marble, the table also being of the same material. In front is a circular ornament containing a representation of a pelican and its young, whilst above the table is the pyx of variegated alabaster, flanked on each side by the representation of an angel bearing a thurifer.

A HANDSOME stained-glass window, which has recently been placed in St. Giles's Parish Church, Newcastle-under-Lyme, was dedicated on Sunday, the 28th ult., with considerable ceremony, the Mayor and Corporation attending in state to do honour to the occasion. The window is an artistic specimen, and has been supplied by Messrs. Hardman & Co., of Birmingham, the cost being about 1,000*l*. The design occupying the seven principal lights is the Crucifixion.

THE old parish church of Swinton, South Yorkshire, having taken fire owing to defective heating apparatus, has been burnt down. In about half an hour the roof fell in, and the old-fashioned high-backed seats and gallery were consumed. The parish documents were saved by the curate, the Rev. J. G. Patrick. The damage is estimated at about 3,000*l*., and the church was insured for 2,000*l*.

### TRADE NOTES.

MESSRS. E. H. SHORLAND & BROTHER, of Manchester, have just supplied their patent warm-air ventilating Manchester grates to the Upton Asylum, Chester.

MESSRS. STEEL & GARLAND, LIMITED, of Sheffield and London, have declared and paid a dividend on the ordinary shares at the rate of 11 per cent. per annum for the half-year ending December 31, 1896.

THE Frost-Proof Water-Pipe Syndicate, Limited, has recently been formed in Birmingham to develop certain patents it has acquired for preventing the splitting of water service pipes under the action of frost. Some very severe tests of the pipe have just been completed in Birmingham. With the aid of a large local ice-making plant, lengths of the pipe, after being filled with water and the ends hermetically sealed, were frozen solid throughout, then thawed and tested for leakage under pressure, this cycle of operations being repeated on one length of pipe many successive times without a sign of a fracture. We understand that a public company will shortly be formed to put it on the market, and shall doubtless be able later on to describe and illustrate fully what certainly appears to be a very valuable commercial invention.

### WOOD PAVING IN EDINBURGH.

A DEPUTATION from Edinburgh Town Council, which was sent to London to collect information in regard to the best methods of wood paving, reports that the members are satisfied that the Australian hard woods possess valuable and peculiar qualities, rendering them highly suitable for street paving purposes. They consider that the hard woods recommended will not be excessive in cost, nor far behind in durability, having in view the fact of Edinburgh traffic being so much lighter than that of London. On the respective merits of the various woods they recommend that black butt and tallow wood be fairly tested. In view of the fact that Edinburgh depends so largely

### CONTRACTS.

THE LONDON GUARANTEE & ACCIDENT  
COMPANY (Limited) issue Bonds as security on behalf of  
Contractors or Builders for the due performance of Govern-  
ment, Municipal, or other Contracts of every description at  
moderate rates. Office, 61 Moorgate Street, London, E.C.  
The Bonds of this Company are accepted by the several  
Government Departments.

for its prosperity on its attractiveness to strangers and tourists, as well as on its comfort for a residential population, the deputation recommends that Princes Street should be paved in sections with Jarrah, Jarrahdale and Karri, with black butt and tallow wood between the tramway rails, and that as much as possible of this should be done while the tramway operations are being executed.

### GLAZED BRICKS.

THE Midland Glazed Brick Company, Limited, established now for many years, have perhaps been more successful than any other fire-clay manufacturers in the Staffordshire district in building up a large and expanding trade in white glazed bricks. When it was first proposed to make these goods in that county the difficulty presented itself whether it would be possible, as the fire-clay of North Staffordshire was more ferruginous than that of Leeds and the North of England, to prevent the iron showing through the enamelled face. By dint of great care in selecting the clay, exposing it to generous atmospheric action, carefully desiccating and slow skilful firing in the kilns, the Midland Glazed Brick Company are now able to produce most satisfactory glazed surfaces.

It is claimed, moreover, and we think with a measure of reason, that the Staffordshire clays being remarkably dense and impregnated with granulated iron, there is less danger of these bricks absorbing and retaining the damp, either externally or from other causes, than with the clays mined in other districts.

At least, from the growing estimation in which the bricks are held by architects and engineers, it would appear that what the Midland Glazed Brick Co. claim are generally admitted as facts. Probably the specially hard enamel, obtainable only in the potteries where the works are situated, lessens also the risks of the crazing or chipping of the glazed surfaces so often complained of.

We learn on good authority that the company's goods have been selected and used in fifty-four Board and public schools in the United Kingdom, and as the rough usage in these buildings is perhaps greater than in any other edifices, there is good reason to credit what is claimed.

We are informed that in the palatial hotel now being erected on the Duke of Bedford's estate, to be known as the Hotel Russell, the Midland Company's white glazed bricks will be used throughout.

The London agents are Messrs. Freeman & Freeman, of 200, &c. Phoenix Street, St. Pancras Station, N.W., where a stock is kept, or samples can be seen.

### FIRE AT CHESTER TOWN HALL.

AN alarming fire, which for rapidity and extent of destructiveness has not been equalled even in the eventful history of old Chester, occurred at the town hall there on Saturday evening.

The fire, which commenced in the council chamber, was fanned by a strong westerly wind, the roof was soon ablaze, and in twenty minutes from the discovery of the outbreak the roof fell in. The flames were fortunately driven across the building by the westerly wind, and this facilitated the efforts of the firemen in saving the remainder of the pile. Had the wind been in a northerly direction it would have been practically an impossibility to prevent the total destruction of the hall. As it was the flames blazed fiercely towards the tower, and at one time communicated with the huge wooden beams running up the centre. In half an hour the flames were confined to the area of the council chamber, and when the steamer got into proper working order mastery was soon obtained of the flames.

The portraits which were hung in the mayor's parlour and the committee rooms were saved, but some were seriously damaged in the process. The fire burned through the door leading from the council chamber to the adjoining room, but there it was checked. It was difficult to give even an approximate idea of the damage, but it will probably amount in round figures to 10,000*l*. This loss is covered by insurance in several offices.

The cause of the outbreak is a matter of conjecture. That it started immediately over the ceiling of the council chamber is certain, but whether it had ignited suddenly or been smouldering for some time cannot be ascertained. It is stated that one of the chimneys at the north end of the hall was on fire in the evening, and that fact, together with the surmise that there had been a defective flue running near the roof, would supply sufficient cause for the outbreak.

The town hall, which is built in the Gothic style, was erected at a cost of 50,000*l*. The foundation-stone was laid in October 1865, by the mayor, Mr. Robert Frost, and the building was opened by the Prince of Wales on October 15, 1869, on which

occasion the mayor, Alderman T. G. Frost, was knighted. By a strange coincidence the old Exchange or town hall, which occupied an adjoining site, was entirely destroyed by fire in December 1863, and it was believed that the outbreak on that occasion was also due to a defective flue.

### CONVALESCENT HOME, LITTLEHAMPTON.

ON March 21 the new Convalescent Home, erected by Mr. Henry Harben, at a cost of over 50,000*l.*, was opened. It is intended for the reception of working men. It is built in the Georgian style of architecture, and stands in grounds of over nine acres. It is set back 250 feet from the esplanade, and has a frontage of over 170 feet. It is lighted throughout by electricity. The westward end of the home is marked by an octagonal bay, this being carried up two floors, while on the east wing is the entertainment hall. On each side of the main entrance is a sheltered terrace, facing due south, on which seats are placed, so that the inmates may have the full benefit on fine days of the sun and the Channel breezes. This sheltered terrace is 5 feet above the level of the roadway, and about 14 feet above high-tide level. The entrance is reached by a flight of stone steps, and over this rises a square tower surmounted by a copper dome having a large dial clock face on each of the four sides, and higher still, and supported in a teak turret is the hour-bell (weigh 8 cwt.), to which is attached an electric fire alarm. The main corridor, which runs east and west, is 112 feet in length and 7 feet wide, the walls being faced with white and green glazed bricks, and the flooring of oak and jarrah wood laid diagonally. The room of the secretary is entered from the main corridor, and adjoining this is the matron's-room, in which there is a switch-board, giving the matron absolute control over the electric-lighting arrangement; electric bells communicate from each room, and the laundry, engine-house, electric-light station and engineer's cottage can be communicated with from the matron's-room by telephone. The waiting or medical-room is next to the matron's-room, and is fitted with cupboards for the use of the medical officers. There is a large smoking-room, well-lighted and ventilated, overlooking the terrace towards the sea.

Adjoining is the quiet room for private meditation and prayer; also a spacious and handsome reading-room and library, well fitted with enclosed bookcases of pitch-pine, and

having two fireplaces and a large octagonal bay window, through which extensive views north, south and west can be obtained. At the extreme west end of the corridor is the patients' entrance and immediately inside the porch is the lavatory, fitted with large wash basins with a supply of hot and cold water, &c., and from the lavatory is a teak staircase leading to the boot-room in the basement and to the garden. The dining-room is capable of seating forty persons, although by the use of small tables sixty can be comfortably accommodated. What is known as the administrative block is entirely separated from the home. There is a large kitchen, the walls of which are lined with glazed bricks, and it is fitted with large range and hot plate, &c., and has a lift to the meat store under. The scullery, which adjoins, is also lined with glazed brick, fitted with steam appliances for fish and vegetables, and other cooking apparatus, white glazed sinks, &c., the heating of both fresh and salt water for baths being arranged from these services, while the salt water is passed through copper tubes in a large cylinder and heated by steam. The servants' hall, which is near the kitchen, is provided with private lockers, &c., for the servants; and there are two larders, wine, beer and matron's store, and large coal cellar, all of which are lined with white glazed brick; while there is an electric lift, which can be used for both passengers and luggage, opposite which is a servants' staircase running to the entire height of the building and communicating with the bedrooms set apart for their use. The principal staircase leads from the centre of the main corridor immediately opposite the front entrance; it is of solid teak, with pitch-pine balusters and strings, and is lighted by electric lights from gun metal standards fixed on the panels, the windows being filled with painted glass with artistic designs emblematic of "Peace and Rest." On the second flight of the great staircase—that is, from the first to the second floor of the building—is a second painted-glass window. The first floor corridor is the same length as the main corridor, 112 feet, and it is heated by means of radiators, is lined with glazed bricks in two soft-toned shades, and has panelled pitch-pine ceilings and polished oak or jarrah wood floor in squares laid diagonally.

The invalids' room is at the extreme west over the reading-room and is arranged to form a comfortable day-room or ward. This is one of the most handsome rooms in the home, and a lovely view is to be obtained from the octagonal bay window; this bay, having a fireplace, is so arranged that it can be curtained off to form a sitting-room for any patients who may be unable to go downstairs. There are bedrooms on each side

of the corridors. Two bath-rooms are on the second floor, fitted with hot and cold fresh water supply, and hot and cold salt water, housemaids' sink, hot air linen cupboards, &c. The matron's bedroom is so situated as to adjoin the only entrance from the administrative block to the home; it is fitted with switches for shutting off the electric light to any portion of the home, the electric-lighting system being so perfected that the light can be switched on to any bedroom upon the patient communicating with the matron by bell; while there are also a fire-alarm and telephonic communication with the engineer's cottage at night. Every detail, indeed, has been most carefully thought out, even to the locks, which throughout have been specially designed, so that should a patient be locked in his room and unable to open the door, the matron with her master key can open the door from the outside, whether the key is in the lock or not. The bedrooms on both floors are similar, and every bedroom has a fireplace. In addition to the two bath-rooms there is on the second floor a room with fresh-water douche. A tank-room adjoining contains tanks to hold 3,000 gallons of fresh water and 1,000 gallons of salt water; the sea-water is pumped by electric motor from a tank underground, which is filled at high tide direct from the English Channel. The electric-light station is built some 300 feet to the rear of the home, everything being in duplicate. The whole of the laundry apparatus is worked by an electric motor, and there is a pump-house in which there is a well 50 feet deep, from which the whole of the fresh-water supply is obtained, and there is a Maignen's apparatus for softening the water. There are also houses for the engineer, gardener, &c. The buildings have been erected by Messrs. Holland & Hannen from the designs and under the superintendence of Mr. Frederick Wheeler, of London and Horsham.

### MANUAL INSTRUCTION CENTRES.

THE following circular has been issued by the Education Department:—"My lords have had under consideration the question of the construction and situation of rooms for manual instruction in connection with public elementary schools. They find that these rooms have often been built on sites originally approved only for ordinary school accommodation, and that the open playgrounds have thereby been reduced in size and the sources of fresh air supply to the schools have been injured, in violation of the principles laid down in the building rules (see

rule 15, schedule 7, New Code). They consider that the following rules should be observed:—(1) Manual instruction should not be given in the classrooms of the school. (2) A room to be used for manual instruction need not be on the same site as the school to which it is attached. (3) A room to be used for manual instruction should not be built on a site already occupied by the playground of a school, unless it can be so built that the school continues fully to fulfil the conditions of building rule 15 as to uncovered space, and that the supply of fresh air to the school is not impeded. (4) The plan, arrangements, construction, lighting and ventilation of the room should be those suitable for a workshop rather than those suitable for a school. The construction should accordingly be simple. The roof may be either of lean-to or other ordinary form according to circumstances. Its height at the windows in front of the benches need not be more than 10 feet. The light must be ample. The temperature should not be so high as in an ordinary classroom. A flat ceiling is not as a rule necessary. The ventilation should be ample by inlets at a height of 5 feet from the floor and by outlets at the highest point. Their lordships are informed that satisfactory buildings can be provided at a cost of 10s. per superficial foot, and that the maximum cost ought never to exceed 15s."

### THE AMERICAN TARIFF.

IN the new American Tariff Bill the following charges are proposed to be levied on building materials, &c.:—

Firebrick, not glazed or decorated, 1 dol. 25 cents per ton; glazed or decorated, 30 per cent. *ad valorem* (against 25 per cent.).

Brick, other than firebrick, not glazed or decorated, 25 per cent.; if glazed or decorated, 30 per cent.

Tiles, glazed or unglazed, valued at not exceeding 40 cents per square foot, 8 cents per square foot; exceeding 40 cents, 10 cents per square foot and 25 per cent. *ad valorem* (against 25 per cent. unglazed and 40 per cent. glazed).

Roman, Portland and other hydraulic cement in packages, 8 cents per 100 lbs., including weight of package in bulk, 7 cents per 100 lbs. (against the same and other cements, 10 per cent. *ad valorem*).

All articles composed of earthen or mineral substances not specially provided for, if not decorated 35 per cent., if decorated 45 per cent. (against 30 per cent. *ad valorem*).

#### MACKIE'S PATENT "DEFIANCE" HYDRAULIC WATERTIGHT FLOOR SPRING AND CHECK.

Size of Plate,  
12 x 8 in.  
Size of Box,  
10 1/2 x 6 x 3 1/2 in.

**906**  
80/-  
With top centre  
and brass shoe any size.

This Floor Spring is suitable for any sized door, and can be regulated to suit any force required.

The box is watertight and weatherproof, a distinct advantage when fixed in Banks, Board Schools, Libraries, and similar places, where the floors are frequently washed down.

It is also sent complete with an outer box to fix into floor, to facilitate the spring being taken out when necessary.

Working Models of these and other Specialties may be seen at our newly-fitted London Showrooms, 57 HOLBORN VIADUCT, E.C. Architects and Buyers are respectfully invited to inspect same.

Gas retorts 3 dols. each, lava tips or burners 10 cents gross, and 15 per cent. *ad valorem*, carbons for electric lighting and filter tubes 50 per cent. (against 20 per cent. for gas retorts), porous pots for electric batteries without metallic connections 20 per cent.

Unpolished cylinder, crown and common window glass not exceeding 10 inches by 15 inches square,  $1\frac{1}{8}$  cent per lb. (against 1 cent); above that and not exceeding 16 inches by 24 inches,  $1\frac{1}{8}$  cent; not exceeding 24 inches by 30 inches,  $2\frac{3}{8}$  cents; 24 inches by 36 inches,  $2\frac{7}{8}$  cents; 30 inches by 40 inches,  $3\frac{3}{8}$  cents; 40 inches by 60 inches,  $3\frac{7}{8}$  cents; above that,  $4\frac{3}{8}$  cents (against  $2\frac{1}{8}$  cents); provided that unpolished cylinder, crown and common glass imported in boxes shall contain 50 square feet as nearly as sizes will permit, and the duty shall be computed thereon according to actual weight of glass.

Cylinder and crown glass polished not exceeding 16 inches by 24 inches, 4 cents (against  $2\frac{1}{2}$  cents per square foot); 24 inches by 36 inches, 6 cents (against 4 cents); 24 inches by 60 inches, 20 cents (against 15 cents); above that, 40 cents (against 20 cents per square foot).

Fluted, rolled or rough plate-glass, or the same containing a wire netting within itself, not including crown, cylinder or common window glass, not exceeding 10 inches by 15 inches square,  $\frac{3}{4}$  cent per square foot; 16 inches by 24 inches, 1 cent (against  $\frac{3}{4}$  cent); 24 inches by 30 inches,  $1\frac{1}{2}$  cent (against 1 cent); all above that 2 cents (against  $1\frac{1}{2}$  cent); and all fluted, rolled or rough plate-glass weighing over 100 lbs. per 100 square feet shall pay an additional duty on the excess at the same rates herein imposed provided that all the above plate-glass, when ground, smoothed or otherwise obscured shall be subject to same rate of duty as cast polished plate-glass unsilvered.

Cast polished plate-glass, finished or unfinished and unsilvered, not exceeding 16 inches by 24 inches square, 8 cents per square foot (against 5 cents); 24 inches by 30 inches, 12 cents (against 8 cents); 24 inches by 60 inches,  $22\frac{1}{2}$  cents; above that, 35 cents (against  $22\frac{1}{2}$  cents).

Cast polished plate glass silvered and looking-glass plates, not exceeding 16 inches by 24 inches square, 9 cents per square foot; 24 inches by 30 inches, 13 cents (against 10 cents); above that, 40 cents (against 23 cents); but no looking-glass plates or plate-glass silvered when framed shall pay less rate of duty than that imposed upon similar glass of like description not framed, but shall pay, in addition thereto, upon such frames the rate of duty applicable thereto when imported separate.

Cast polished plate-glass, silvered or unsilvered, and cylinder, crown or common window glass, when silvered or unsilvered, when bent, ground, obscured, frosted, sanded, enamelled, bevelled, etched, embossed, engraved or otherwise ornamented or decorated, shall be subject to duty of 10 per cent. in addition to the rates otherwise chargeable thereon.

Stained or painted windows, glass windows or mirrors, not exceeding 144 square inches, and all glass or manufactures of which glass or paste is component material of chief value not specially provided for, 45 per cent.

Bar iron, rolled or hammered, comprising flats, round iron not less than  $\frac{7}{8}$  of an inch in diameter, and square iron not specially provided for, 6-10c. per lb.; round iron in coils or rods, less than  $\frac{7}{8}$  of an inch in diameter, and bars or shapes of rolled iron not specially provided for, 8-10c. per lb., provided all iron and slabs, blooms, loops, or other forms less finished than iron in bars and more advanced than pig-iron, except castings, shall be subject to a duty of 5-10c. per lb., provided all iron bars, blooms, billets, or sizes or shapes of any kind in manufacture of which charcoal is used shall be subject to a duty of 12 dols. per ton.

Boiler and other plate-iron or steel for whatever purpose used, except saw-plates hereinafter provided for, not thinner than No. 10 wire-gauge, and skelp-iron or steel valued 1c. per lb., 5-10c. per lb.; valued above 1c. and not above 2c., 6-10c. per lb.; not above 4c., 1c.; over 4c., 30 per cent. *ad valorem*, provided that all plate-iron or steel thinner than No. 10 wire-gauge shall pay duty as iron or steel sheets.

Hoop or band or scroll or other iron or steel valued at 3c. per lb. or less, 6-10c. to 9-10c., provided that hoop or band-iron or steel cut to length or wholly or partly manufactured into hoops or ties shall pay 1-10c. more duty.

Railway bars of iron or steel or part steel and rails, 7-20c. per lb.; railway fish plates,  $\frac{1}{2}$ c. per lb.; sheets of iron or steel, common or black, including all iron or steel commercially known as common or black, taggers, iron or steel and skelp iron or steel valued at 3c. per lb. or less, thinner than No. 10 and not thinner than No. 20 wire gauge, 7-10c. per lb.; not thinner than No. 25, 6-10c.; not thinner than No. 32, 1 1-10c.; thinner than No. 32, 1 2-10c.; provided all common or black sheet iron or sheet steel not thinner than No. 10 shall pay duty as plate iron or steel.

Sheet iron or sheet steel polished, planished, or glanced by whatever name designated, 2c. per lb., provided that plate or sheet or taggers, iron or steel other than the polished, planished,

or glanced herein provided for which have been pickled or cleaned by acid or by any other material or process or which is cold-rolled or smoothed only, not polished, shall pay  $\frac{1}{4}$  c. per lb. more than corresponding gauges of common black sheet or taggers iron or steel.

Sheets or plates of iron or steel or taggers iron or steel, coated with tin or lead, commercially known as tin plates, terne plates and taggers tin,  $1\frac{1}{4}$  c. per lb.; no allowance or reduction of duties shall be made for partial loss or damage in consequence of rust or of discolouration upon any description of iron or steel or upon any article wholly or partly manufactured of iron or steel or upon any manufacture of iron or steel.

On all iron or steel bars or rods of whatever shape or section, which are cold-rolled, cold-drawn, cold-hammered, or polished in any way in addition to ordinary processes of hot rolling or hammering there shall be paid  $\frac{1}{4}$  c. per lb. in addition to rates provided.

On bars or rods which are hot rolled and on all plates or sheets of iron or steel of whatever shape other than polished, planished, or glanced sheet iron or sheet steel before provided for which are cold-rolled, cold-hammered, blued, brightened, tempered or polished by any process in such perfected surface finish or polish better than the grade of cold rolled smooth only before provided for there shall be paid 1 c. per lb. additional duty, and on steel circular saws  $\frac{3}{4}$  c. per lb. in addition to the rate provided for steel saw plates.

### EXTRAS AND DAMAGES FOR DELAY.

ON Saturday, the 20th ult., the case *Dodd v. Chinton* came before the Court of Appeal. It was a builder's action brought to recover balance due under a contract, and was originally tried in the Whitchurch County Court. The claim was admitted, but there was a counterclaim by the building owner to recover 50% as liquidated damages for delay in completing the work. By the contract the plaintiff undertook to make certain alterations and additions to the defendant's house for 664%, as set forth in the specification and according to the general conditions annexed thereto. By clause 1. of the general conditions "the whole of the works, and any other works that may be ordered as additions to this contract, are to be executed and completed in the best and most workmanlike manner, and with the best materials of their several kinds, and everything to be done to the full spirit and intent of this contract, which is intended to

comprise everything necessary to the perfect completion of the works. Every part of the works to be done to the satisfaction of the architects, and their direction to be followed in every respect, and their opinion on all questions relating to the works or contract to be final and conclusive." Clause 4:—"Any authority given by the architects for any alteration or addition in or to the works is not to vitiate the contract, but all additions, omissions, or variations made in carrying out the works for which a price may not have been previously agreed upon are to be measured and valued and certified for by the architects, and added to or deducted from the amount of the contract as the case may be, according to the detailed schedule of prices on which the contract was formed. The schedule of prices to apply to all deductions and to additions up to 15 per cent. above the amount of the contract; any additional works beyond 15 per cent. above the amount of the contract and any item to which the schedule of prices does not apply to be allowed for at such prices as the architects may consider fair and reasonable." Clause 24:—"... the whole of the works to be completed by the first day of June, 1892, under a penalty of 2% per week for every week that any part of the works remains unfinished after that date as liquidated damages." Extra works to the amount of 22% 18s. 8d. were ordered, and the total works were not completed until twenty-seven weeks after the time specified for completion. The defendant, after allowing two weeks additional time for the completion of the extra works ordered, counterclaimed for 50%, being 2% per week for twenty-five weeks, as liquidated damages for the delay in completion. The County Court judge held that the ordering of the extra works was a waiver of the stipulation to pay damages for delay, and gave judgment for the plaintiff on the counterclaim. In the Divisional Court Mr. Justice Wills agreed with the County Court judge, while Mr. Justice Wright differed. The judgment of the County Court judge therefore stood. The defendant appealed.

The Court dismissed the appeal.

The Master of the Rolls said that the question was whether the building owner was entitled to claim certain penalties by way of liquidated damages from the builder on account of the works not having been completed in the specified time. It was said that the building owner disintituled himself from claiming the penalties by having ordered extra work to be done beyond that provided for in the specification. The extra work admittedly delayed the completion beyond the time that would have been occupied in executing the specified works. The

contract gave the building owner the right to call upon the builder to do extra works. A recognised rule had been laid down in *Holme v. Guppy* that if the building owner ordered extra works beyond the specified works which increased the time necessary for completion, the building owner was disabled from claiming penalties for delay in completion. If that were not so, it would be a most unreasonable burden to put upon the builder to do extra works; and then, if the whole works were not completed within the specified time, to claim the specified penalties from him. Then it was held in *Westwood v. Secretary of State for India* that the fact that the contract entitled the building owner to call upon the builder to do extra works did not prevent the application of the above rule. Then came *Jones v. St. John's College*, which was an exception to that rule. In that case it was stated in the pleadings that the builder had agreed, if extra works were ordered, to complete the entire works within the stipulated time. The Court held that if the builder was foolish enough to agree to that, even though it became impossible to complete the works within the time, he must take the consequences. In the present case the builder did not by the agreement undertake such a foolish responsibility. The rule of construction was that if a particular construction led to an unreasonable result the Court would be slow to adopt that construction. In *Jones v. St. John's College* the contract was set out in the pleadings and admitted on demurrer. The present contract could not be construed as was the contract in *Jones's* case. Therefore, the building owner, though entitled by the contract to order extra works, had, by ordering the extra works, deprived himself of the right of claiming the penalties for delay. They would, therefore, adopt the judgment of Mr. Justice Wills in preference to that of Mr. Justice Wright.

The Lords Justices delivered judgment to the same effect.

### THE CHEMISTRY OF METALS USED IN CONSTRUCTION.

A LECTURE by Professor J. M. Thomson on "The Chemistry of Certain Metals used in Building Construction" was given at Carpenters' Hall on the 17th inst. The Professor referred to the difficulty of selecting a suitable subject. Having in previous lectures dealt with "Building Stones, Mortars and Cements" and with "Some Preservative Agents," the first idea was to say something in regard to wood. It might, however, have

seemed impertinent to speak to those who are thoroughly acquainted with wood in their own particular hall, and therefore "Metals" had been selected as the subject. By a series of experiments an endeavour would be made to consider certain principles which underlie the chemical changes taking place in the extraction of metals from their ores, and in the action of air, water, carbonic-acid gas and various acids on metals. A primary distinguishing feature between metals and other bodies is that metals united with oxygen form a base, or basic body. Next comes the characteristic that all metals are expanded by heat. This is of great importance, and is a point that has to be considered in placing a lengthy piece of metal in a building. Different metals have different degrees of expansion. A bar composed of two metals fastened side by side, one of which expands readily and to a great extent, the other reluctantly and to a less degree, if exposed to the action of heat will curve and twist in a peculiar manner as the result of this difference in the properties of the two metals.

Other properties of metals are tenacity, malleability, ductility and fusibility. Copper is an extremely tenacious metal. It can be elongated without breaking, and is largely used in the form of wire. The purer the copper the more tenacious the wire. No one would think of using a lead wire, it would break at once. But lead is malleable, and is extremely useful as a covering body because of its resistance to atmospheric action. It is also used in the manufacture of sulphurous acid. Lead sheets can be worked into any desired form. Metals are fusible at greatly varying degrees of temperature. Certain metals fuse in boiling water. Alloys composed of two or more metals exhibit peculiar phenomena. Many fuse at a much lower temperature than either of the component metals. This is the case with Rose's alloy, Wood's alloy, and with all kinds of type metal.

In extracting metals from their ores the great change which takes place is the reaction of reduction. This is carried out by several methods, by the simple fusion of the ore, or by reducing the ore with gases, generally hydrogen or carbon monoxide. In certain cases of reduction there is an extraneous change, the constituents of the ores being made to assist in the operation. In the lead furnace the fire plays over the ore and sulphurous-acid gas is formed, and the resulting reaction between the sulphide and oxide of lead facilitates the reduction. The open blast furnace, which many will remember, has given place to a furnace in which the gases evolved are collected at the top and made to pass over the fire, thus cheapening the process of

SPECIAL ATTENTION GIVEN TO ARCHITECTS' DESIGNS.

## ART PLATES.

PROOFS on Special Paper of the beautiful frieze, by P. V. GALLAND, which was commenced in our Special Double Number of January 3, can now be obtained on application to the Publisher. They consist of five pieces, as follows:—

**Architecture,  
Stone Cutting,  
Bricklaying,  
Carpentry,  
Joinery.**

The Plates are produced in a light artistic brown, with a gold background, and form one of the best decorative examples which have appeared for many years past.

The size of each Plate is Fifteen Inches wide by Ten Inches in depth. As only a limited number of proofs have been taken, early application should be made.

The price is Ten Shillings the set, free by post in patent roller.

reduction of the iron from the ironstone packed between layers of coal and limestone in the furnace.

A great number of metals are extracted by the fusion of a compound of the metal, generally a haloid compound, with another metal. Aluminium was originally extracted in this way by the use of sodium, but is now obtained by the reduction of electrolysis. Various galvanical or electrical processes are adopted for the reduction of metals, the most common being that in which the ore is decomposed by an electrical current. Another method is by amalgamating the required metal with mercury and then recovering the mercury. This is frequently done in extracting gold.

The rusting of iron is very familiar, but it is not a simple matter to say what actually takes place. A ready assumption is that the first coating of oxide or rust should have a protective influence, but it is not so, because the chemical change is a continuous one. Iron exists in a perfectly colourless form, but it is difficult to keep it so unless air is excluded. Certain springs which contain iron, although quite colourless at their source, soon impart by the action of the air a brown colouring to their banks, or the stream itself is tinged with brown. If water containing iron in this colourless state be rapidly agitated with air in a large glass vessel it will become brown. It is by the strong affinity of iron for the oxygen of the air that rust is formed, and can only be prevented by some preservative covering. In the case of iron lined with tin or zinc, so long as the lining is perfect no action takes place, but the moment a fault occurs a reaction is set up, very often increased by the electric or galvanic action of the one metal on the other. Lead, it has been stated, withstands the action of the atmosphere, but it is readily acted on by vinegar, as in the manufacture of white lead, and by most vegetable acids. There is a considerable amount of vegetable acids present in the soil, and their presence in union with carbonic-acid gas has a serious corrosive effect on lead pipes. The lead becomes reduced to a fine white powder, and the pipe is pitted with holes. Very few waters affect lead, a small quantity of mineral matter in the water generally forming at once an insoluble sulphide of lead on the surface, which becomes a protective coating and prevents further action. Waters containing mineral matter are said to be hard waters. With a very soft or with an absolutely pure water the lead is more assailable.

Many substances too numerous to mention act on metals. Chlorine acts readily on certain metals, and is largely used in

the haloid processes above referred to. Chlorine fumes are extremely powerful; when used for disinfection all metals have to be covered up and protected, or they become much corroded. Chlorine has a powerful influence on copper. The soft green colour of copper spires is produced by the chemical action of the air; but climate has much to do with the process, as much finer effects are seen abroad than with us. By treating copper with ammonia, and then with an oxidising agent, similar results might be obtained.

A series of interesting experiments illustrating and explaining the various phenomena was given by the Professor, who received an enthusiastic vote of thanks on the motion of Sir F. Abel, who presided.

### STEAM ENGINES AND BOILERS BILL.

THE Liberty and Property Defence League has issued a protest against this Bill, which was read a second time in the House of Commons on February 17, in which it is stated that during the last twenty years no accident attributable to ignorance or incompetence on the part of "persons in charge" has occurred in the United Kingdom, except in trades exempted from this Bill. Owners of expensive boilers and engines never have given and never will give charge of their property to a mechanic without first inquiring into the mechanic's fitness for his work. No owner of machinery can possibly want to have an explosion or accident on his premises, which might wreck his machinery, stop his business and involve him in heavy damages. There is no demand among trade unionists, engineers, or working men for this Bill, which was devised by a small group of so-called "Labour" leaders. If the Bill became law it would be used by agitators in the following very practical way:—No engine could be started in the majority of factories or in any steam-power-using enterprise in the United Kingdom, unless an officially "certificated person in charge" handled the throttle valve. The "Labour" leaders would insist on every qualified man in the kingdom joining a "Certificated Engineers' Trade Union." A small group of irresponsible agitators in London would then find themselves possessed of statutory power to stop every factory or enterprise depending on steam power in the kingdom in one day. Were the often threatened "general strike" to be attempted by the Socialist Labour party, there might be plenty of perfectly competent and trustworthy men without "certificates" willing

## THE WELL-KNOWN FRIEZE,

ENTITLED

# "THE CORN FIELD."

1. Ploughing.

2. Harrowing.

3. Mowing.

4. Carting.

5. The Products of the Corn Field.

*Length, Fourteen Feet Seven Inches by Fifteen Inches deep.*

A SPLENDID EXAMPLE OF COLOUR-WORK IN PERMANENT INK PHOTO, BY  
**M. PAUL ALBERT BAUDOIN.**

*This magnificent Illustration was presented to the Subscribers to "The Architect" in 1886. A few Proofs were taken, which immediately became out of print.*

### OPINIONS OF THE PRESS.

"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition is being issued."—THE LADY'S PICTORIAL.

"They are beautifully done in colours by the permanent ink photo process, and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—THE STAGE.

"The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour-work in permanent ink photo, by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic, and would grace the walls of any house."—THE GENTLEWOMAN.

AND NUMEROUS OTHERS.

In consequence of the almost daily demand for these Plates, they have been reproduced by Subscription at Half a Guinea the Set, and are now ready for issuing.

**P. A. GILBERT WOOD, 175 STRAND, W.C.**

May be had framed in Solid Oak Frames with Mounts, at Three Guinea the set of Five Plates.

to take temporary charge of pumping, ventilating, &c., engines; this Bill would prohibit any of them going to work until examined and certified by Home Office inspectors.

### THE UNDERPINNING OF HEAVY BUILDINGS.

IN a paper by Mr. Jules Brenchaud, communicated to the American Society of Civil Engineers, the writer refers to the great difficulties experienced in preventing injury, by settlement of heavy buildings, when it is necessary to excavate and build on the immediate adjacent building site.

The specific case treated of is a building which was to be carried 30 feet (two storeys) below the street level, over one half of which had to be made watertight, as it was below water-level. The total depth of foundation being 45 to 50 feet below the sidewalk, these foundations consisted of close-fitting rectangular pneumatic caissons all around the exterior of the new building site and cylindrical intermediate ones for columns.

As every square foot of the property had to be built upon the problem was to pin the adjacent buildings up during caisson sinking and construction periods. This was accomplished by placing vertical cylindrical iron columns in slits in the walls, extending from the foundation upwards. These were founded at the bottom on rock or very hard hard-pan, and at their tops the bearings were spread out by transverse horizontal slits in the walls, in which were placed nests of I beams on top of the columns.

The cylindrical columns were 10 inches to 30 inches in diameter, the smaller ones being forced down by a 60-ton hydraulic jack, in sections 5 feet long at a time, to proper bearing; some also were partially sunk by water jet. The larger ones under the heavier building were sunk by compressed air, as neither the water jet nor jack would force them through a layer of hard-pan to the rock.

The larger columns were first made of cast-iron, but after one becoming injured by forcing past a boulder, the rest were made of rivetted steel sections.

These columns were filled, after sinking, with Portland cement concrete.

The writer then details several similar cases where the application has been successful, and concludes by stating that, while this method is not (evidently) of universal application, it will be found the best means of transferring the load of an

adjacent building to a lower foundation with a minimum of obstruction to the building site about to be used; also that, as these underpinnings are left in place, there is no danger of that slight subsidence which takes place when other kinds of temporary underpinning are removed.

### PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

#### APPLICATIONS FOR PATENTS.

6834. William Thompson, for "Improvements in the method of constructing casement windows."

6869. Julius Theodor Köhler, for "An improved press for manufacturing tiles."

6937. William Oates and John Johnston Green, for "A socketless access pipe for making connections or repairs in drain pipes and in the method of connecting same."

6996. Richard Brown Evered, for "Improvements in water-closets."

7017. William Hewitt, for "Improvements in apparatus for the manufacture of tiles."

7062. Thomas Parker, for "Improvements in and relating to brick-making machines."

7086. George Gore Meyer, for "Improvements in the construction of scarf slides or fastenings."

7157. William Hall Keys, for "Improvements in the manufacture of certain bricks, tiles, and the like."

7169. John Shanks, for "Improvements in trough closets or latrines."

7266. Samuel Fildes and Henry Fildes, for "Improvements in window fasteners."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 73 Chancery Lane, London, W.C.

# THE NEW EXPANDED METAL

Meshes from  $\frac{1}{8}$ th in. to 6 in. wide. Strands from 24 B.W.G. to  $\frac{3}{16}$ th in. thickness of steel.

**FOR BUILDING CONSTRUCTION**, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

**FOR SOLID PLASTER PARTITIONS**, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

**FOR FIREPROOF LATHING**, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

**FOR CONCRETE FLOORS WITH EXPANDED METAL**.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

**FOR EXTERIOR WALLS OF BUILDINGS**.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

**FOR FENCING, TREE GUARDS, WINDOW GUARDS**, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

**ORNAMENTAL. STRONG. CHEAP.**

**OTHER USES FOR EXPANDED METAL**.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away.

Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

**BRASS, ALUMINIUM**, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

**CATALOGUES AND PRICE LISTS** can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

**THE EXPANDED METAL COMPANY, LTD.,**

**39 UPPER THAMES STREET, LONDON, E.C.**

Telegraphic Address, "Distend, London."

Works—WEST HARTLEPOOL.

Telephone No. 1829.

## Architect and Contract Reporter.

## EDITORIAL NOTICES.

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

## NEW READING CASE.

**To Librarians of the Public Libraries and Reading-rooms.**—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

## NOTICE.

*Next Friday being Good Friday, THE ARCHITECT will be published on Thursday. All Advertisements intended for this Number must reach the Office not later than 3 p.m. on Wednesday, April 14.*

*For Advertisement Scale, see page xv.*

## CONTRACTS OPEN.

**ABERYSTWYTH.**—For erection of a school and house adjoining the Shiloh Chapel. Messrs. Hipkiss and Bassett, architects, Post Office Chambers, Terrace Road, Aberystwyth.

**ALNWICK.**—April 13.—For erection of a pair of villas, Swansfield Park Road. Mr. Wm. Robson Hindmarsh, jun., architect, Alnwick.

**ALNWICK.**—April 10.—For erection of a pair of cottages, Hotspur Place. Mr. Wm. Robson Hindmarsh, jun., architect, Alnwick.

**ASHTON-UNDER-LYNE.**—April 14.—For constructing embankment, &c., for formation of reservoir. Messrs. G. H. Hill & Sons, 3 Victoria Street, Westminster.

**BARNESLEY.**—April 13.—For erection of twelve houses in Farrar Street. Mr. George Moxon, architect, Central Chambers, Church Street, Barnsley.

**BATH.**—April 12.—For extension of the buildings of the Bath Corporation electric-light works, Dorchester Street. Mr. F. H. Moger, clerk, 3 Wood Street, Bath.

**BELFAST.**—April 12.—For rebuilding shop and stores in Castle Place. Messrs. J. J. Phillips & Son, architects, 61 Royal Avenue.

**BELFAST.**—April 16.—For extensions to shop premises, corner of Bridge Street and High Street. Messrs. J. J. Phillips & Son, architects, 61 Royal Avenue, Belfast.

**BELPER.**—April 17.—For erection of new isolation hospital on Crich Lane. Mr. Maurice Hunter, architect, Bridge Street, Belper.

**BIRKENHEAD.**—April 21.—For erection of twenty-five cottages at Hinderton Road. Mr. A. E. Bolter, secretary to L. & N.-W. & G.W. Railway Companies Joint Committee, Paddington Station, London.

**BISHOP AUCKLAND.**—April 10.—For erection of considerable extensions to the St. Anne's Schools. Messrs. Clark & Moscrop, architects, Darlington.

**BODMIN.**—April 17.—For erection of a single residence near the Great Western Railway Station. Mr. William J. Jenkins, architect, Bodmin.

**BRADFORD.**—April 12.—For erection of a large block of warehousing in Union Street, three dwelling-houses in Toller Lane, and dwelling-house, stabling and warehouse in Wilton Street. Messrs. James Young & Co., architects, 62 Market Street, Bradford.

**BRISTOL.**—April 12.—For erection of a warehouse, &c., in Narrow Wine Street. Mr. Thomas Scarnmell, architect and surveyor, 12 John Street, Bristol.

**BUCKHURST HILL.**—For erection of two pairs of semi-detached villa residences. Mr. Batting, 7 John Street, Adelphi, W.C.

**BURLEY-IN-WHARFEDALE.**—For erection of a residence. Messrs. Isitt, Adkin & Hill, architects, Prudential Buildings, Bradford.

**BURNLEY.**—April 10.—For erection of memorial in Scott Park. Mr. Wm. T. Fullalove, town clerk, Town Hall, Burnley.

**BUSHMILLS.**—April 10.—For enlarging church. Mr. David Douglas, Bushmills, Ireland.

**CARDIFF.**—April 10.—For erection of attendants' rooms and carrying-out other alterations at the workhouse. Mr. Edwin Seward, architect, Queen's Chambers, Cardiff.

**CARDIFF.**—April 29.—For taking down the existing chimney-stack, with a portion of the flues, at Cogan Pumping Station, and the rebuilding of the chimney and flues in brickwork. Mr. C. H. Priestley, engineer, Town Hall, Cardiff.

**CASTLEFORD.**—April 15.—For pulling down and setting back boundary wall, Wheldale Lane, and alteration of causeway; also for the taking up and relaying footpath in Bridge Street. Mr. H. H. Broadbent, clerk, Castleford.

**CHATHAM.**—April 26.—For building town hall and municipal offices. Mr. G. E. Bond, architect, High Street, Rochester.

**CLAYTON-LE-MOORS.**—For erection of club-house. Mr. W. Hopwood, broker, Lower Barnes Street, Clayton-le-Moors.

**COLCHESTER.**—April 15.—For erection of an electric-light station, consisting of a boiler-house, engine-house, cast-iron tank and chimney shaft. Mr. H. Goodyear, borough engineer and surveyor, Colchester.

**CORNWALL.**—April 14.—For enlarging, renovating and repewing the U.M.F.C. Chapel at Trevena, Tintagel. Messrs. Wise & Wise, architects, Launceston.

**COUPAR ANGUS.**—April 10.—For erection of additional maltings. Mr. Robert Grant, Bengarth, Blairgowrie.

**COWBRIDGE.**—April 12.—For erection of new classrooms, &c., at Grammar School. Mr. E. Jenkin Williams, architect, 14 High Street, Cowbridge.

**CRICKHOWELL.**—April 13.—For alterations and additions to the National Schools, Llangattock. Mr. F. Baldwin, architect, 8 Lion Street, Brecon.

**CUMBERLAND.**—April 20.—For erection of a stone bridge over the Camp Beck at Walton Mill Ford, in the parish of Walton. County surveyor and bridgemaster of Cumberland, at the Courts, Carlisle.

**DARLINGTON.**—April 12.—For erection of an entrance lodge and model cottages at Neasham Hall. Mr. G. Gordon Hoskins, architect, Northgate, Darlington.

**DUBLIN.**—April 14.—For erection of additional apartments at the Convent House, North Brunswick Street. Mr. John O'Neill, clerk, Board-room, North Brunswick Street, Dublin.

**DUNFERMLINE.**—April 12.—For erection of extensive additions to and alterations on mansion house and stable offices. Mr. Andrew Scobie, architect, Dunfermline.

**DURHAM.**—April 14.—For rebuilding of the Lord Collingwood Hotel, Felling. Mr. H. Miller, Felling.

**DURHAM.**—April 14.—For rebuilding of the Lord Collingwood Hotel, Felling. Mr. H. Miller, architect, Felling.

**EASTBOURNE.**—April 10.—For alterations and additions to Satara, Fairfield Road. Messrs. C. and C. B. Benson, architects, Yeovil, Somerset.

**EBBW VALE.**—April 12.—For erection of a school to accommodate 157 children, near Steelworks Houses, with out-offices, boundaries and playgrounds. Mr. George Rosser, architect, Victoria Buildings, Abercarn.

**ELLAND.**—April 14.—For building a brick chimney, 65 yards high, at Ash Grove Brickworks. Mr. W. H. D. Horsfall, architect, 9 Harrison Road, Halifax.

**ELLAND.**—April 17.—For erection of foundry, shed and offices at Perseverance Works. Mr. W. H. D. Horsfall, architect, 9 Harrison Road, Halifax.

**ESSEX.**—April 19.—For erection of an infirmary on the ground adjoining the school at Witham. Mr. F. Whitmore, architect, Chelmsford.

**FAILSWORTH.**—For erection of business premises and dwelling-houses in Old Lane. Mr. Fredk. W. Dixon, architect, Trevelyan Buildings, Manchester.

**GREENOCK.**—April 12.—For constructing outfall sewer. Town Clerk, Municipal Buildings, Greenock.

**GUIDE BRIDGE.**—For alterations to the Railway Hotel. Mr. J. H. Burton, architect, 2 Guide Lane, Hooley Hill.

**HALIFAX.**—April 15.—For erection of two bridges (32 feet by 13 feet and 28 feet by 13 feet) in the People's Park. Mr. Edward R. S. Escott, borough engineer, Town Hall, Halifax.

**HALIFAX.**—April 15.—For erection of a mill chimney, Haley Hill. Messrs. George Buckley & Son, architects, Tower Chambers, Halifax.

**HALIFAX.**—For erection of a tower at Copley Mills for sprinkler tank; also for making and fixing over 330 windows in same mill, and for the painters' work required in the painting of the whole of the mill premises, over 160 cottages, with shops and school, &c. Mr. Arthur George Dalzell, architect and surveyor, 15 Commercial Street, Halifax.

**HALIFAX.**—April 23.—For erection of a store and fourteen houses on the Newstead Estate, Gibbet Street. Mr. W. Clement Williams, architect and surveyor, 29 Southgate, Halifax.

**HALIFAX.**—April 27.—For taking down the Barrack Tavern and other buildings, &c., in Charles Street and Causeway, in the borough of Halifax, and erecting upon the site additions to the premises of the Automatic Standard Screw Company. Messrs. Jackson & Fox, architects, 22 George Street, Halifax.

**HALIFAX.**—April 20.—For erection of two dwelling-houses. Mr. Medley Hall, architect, 29 Northgate, Halifax.

**HARROW ROAD.**—April 13.—For erection of casual wards in Woodfield Road. Mr. F. J. Smith, architect, 17B Great George Street, Westminster.

**HEATON.**—For erection of four through houses. Mr. John Jackson, architect, Barry Street, Bradford.

**HEBDEN BRIDGE.**—April 15.—For erection of fourteen houses in Melbourne Street. Mr. G. Habbergham, builder, Melbourne Street, Hebdon Bridge.

**HEBDEN BRIDGE.**—April 15.—For erection of a dwelling-house in Old Gate. Messrs. George Buckley & Son, architects, Tower Chambers, Halifax.

**HEYWOOD.**—For erection of houses in Derby Street and Wham Lane. The Secretary, Millbank Brick and Terra-Cotta Company, Limited, Heywood.

**HUDDERSFIELD.**—April 14.—For erection of four dwelling-houses at High Royd, Moldgreen. Mr. J. Berry, architect, 9 Queen Street, Huddersfield.

**HUDDERSFIELD.**—April 22.—For erection of shed, raising the packing shop and other extensive alterations at Meltham Mills. Messrs. John Kirk & Sons, architects, Huddersfield.

**HYTHE.**—April 20.—For erection of a Wesleyan church and schools. Rev. C. Norman, Holmlea, Hythe.

**IPSWICH.**—April 13.—For alterations and additions to Tower House, for the School Board. Mr. J. S. Corder, architect, Tower Street, Ipswich.

**IRELAND.**—April 10.—For erection of creamery at Bunkey Bridge, within easy distance of Castleconnell and Lisnagry railway stations. Mr. W. L. Stokes, Mulgrave Street, Limerick.

**IRELAND.**—April 17.—For erection of house and offices at Carlton premises, Enniskillen. Mr. Thomas Elliott, architect, Enniskillen.

**IRELAND.**—April 14.—For erection of a schoolhouse at Riverstown. The Rev. Andrew Quinn, P.P.

**IRELAND.**—April 15.—For completing the tower and spire of Stranorlar Church, co. Donegal. Mr. William H. Byrne, architect, 20 Suffolk Street, Dublin.

**KEIGHLEY.**—April 12.—For additions to warehouse, &c., New Road Side. Mr. John Haggas, architect, North Street, Keighley.

**KENDAL.**—April 14.—For erection of a fire-brigade station. Mr. John Thompson, architect, 1 Finkle Street, Kendal.

**KENDAL.**—April 17.—For pulling down 18 Wildman Street, Kendal, and for building a new shop and dwelling-house. Mr. John Stalker, architect.

**KETTERING.**—April 14.—For erection of a covered bandstand, circular or octagonal in plan, about 25 feet diameter. Mr. Thos. Reader Smith, engineer and surveyor, Market Place, Kettering.

**LEEDS.**—April 14.—For erection of clubhouse, Roundhay Road. Mr. Chas. D. Swale, architect, 98 Albion Street, Leeds.

**LEEDS.**—For erection of five through houses and alterations to four adjoining houses, situated in Cross Field Lane. Mr. F. J. Butler, Shannon Street, Leeds.

**LEEDS.**—April 21.—For erection of stone abutments and wing walls for steel bridge over the river near Rodley. Town clerk.

**LERWICK.**—April 14.—For constructing waterworks. Mr. A. Sanderson, 72A George Street, Edinburgh.

THE  
**LARGEST & BEST VARIETY OF FANLIGHTS & SASH OPENERS.**  
&c., to suit all requirements, viz. details of work and price, to work by means of the Vertical Screw Rod and Regulator, or Cord.

**SPECIALTIES.**—Door Springs, Fanlight Openers and Gear, Ventilators, Locks and Furniture, Builders' General Ironmongery, Iron Casements and Frames, Architectural and other Metal Work, &c. &c.

**GUARANTEED BEST MATERIAL AND FINISH.**

**LOW PRICES. SAMPLES AND ESTIMATES SUBMITTED.**

**the New Impregnable Patent Bolts and Fastenings for Casements, Doors, Gates, &c., with Handles and Keys for one or both sides.**

**PANIC EXIT BOLTS,**

APPROVED BY THE LONDON COUNTY COUNCIL.

**THE "XIT,"**  
ROBT. ADAMS' PATENT.

No. 190. Solid Section Tongue Bolt, Triple Action, Self-Locking, Weather and Thief Proof, Neat, Simple, and Strong.

**LEICESTER.**—April 30.—For the construction of a concrete and stone bridge over the Leicestershire and Northamptonshire Union Canal and Flood Course, and for the formation of a new road from the Newark to the Western Boulevard, together with a storm overflow, foul and storm-water sewers, and other works in connection therewith. Mr. E. Geo. Mawbey, C.E., borough surveyor, Town Hall, Leicester.

**LIMERICK.**—April 10.—For erection of a gate lodge at Fern Bank. Messrs. J. P. Evans & Co., 131 George Street, Limerick.

**LIVERSEDGE.**—April 13.—For erection of four scullery houses in Granville Street, off Union Road, Berry Hill. Mr. W. Lister, 20 Halifax Road, Dewsbury.

**LLANELLY.**—April 10.—For rebuilding and extending Libanus Independent Chapel, Pwll. Mr. D. L. Jones, architect, West-end, Llanelly.

**LLANGOLLEN.**—April 26.—For erection of County School. Mr. H. Feather, architect, Andrew's Buildings, Queen Street, Cardiff.

**LLANWONNO.**—April 15.—For rebuilding St. David's Church, Gyeillon. Mr. E. M. Bruce Vaughan, architect, Cardiff.

**LEWISHAM.**—April 12.—For repairs at the union workhouse and relief station. Mr. H. C. Mott, clerk, High Street, Lewisham.

**LONDON.**—April 15.—For building casual wards, Harrow Road. Mr. Henry F. Aveling, 289 Harrow Road, W.

**LONDONDERRY.**—April 12.—For erection of five houses at Park Avenue. Mr. E. J. Toye, architect, Strand, Derry.

**LURGAN and BELFAST.**—April 12.—For erection of a new station building in brick on the up-platform at Lurgan, also station building in timber at Adelaide Avenue, Belfast, for the Great Northern Railway Company (Ireland). Mr. T. Morrison, secretary, Amiens Street Terminus, Dublin.

**MANCHESTER.**—April 14.—For erection of a police-station at Stretford, near Manchester. Mr. Henry Littler, architect, 21 Pitt Street, Preston.

**MANNINGHAM.**—April 15.—For erection of two semi-detached villas in Selborne Grove. Mr. T. C. Hope, architect, Old Bank Chambers, Bradford.

**MASBOROUGH.**—April 16.—For erection of six dwelling-houses in Wortley Road. Mr. J. Axleby, architect and surveyor, Wilton Lane, Masborough.

**MIDDLESBROUGH.**—April 12.—For erection of Sunday schools and assembly hall. Mr. Walter G. Roberts, architect, 61 Albert Road, Middlesbrough.

**MIDDLESBROUGH.**—April 14.—For alterations and new shop front to 24 Garnet Street. Mr. Walter G. Roberts, architect, 61 Albert Road, Middlesbrough.

**MITCHAM.**—April 21.—For erection of laundry, laundry-maid's house, baths for boys and infants' lavatories, at schools. Mr. C. E. Vaughan, architect, 25 Lowther Arcade, London, W.C.

**MONMOUTH.**—April 12.—For building engine and boiler houses, pump chamber, &c. Messrs. Bramwell & Harris, 5 Great George Street, Westminster, S.W.

**MONMOUTH.**—April 12.—For erection of engine-house, boiler-house, boiler seatings, flues, chimney shaft and concrete races for the turbines at the generating station, the collecting tanks and pump-chamber at the sewage pumping station, &c. Messrs. Bramwell & Harris, engineers, Great George Street, Westminster, S.W.

**MORTLAKE.**—April 12.—For erection of stables, steam-roller house and cart-sheds at the Mortlake dépôt. Mr. G. Bruce Tones, engineer and surveyor, Council Offices, High Street, Mortlake.

**MORLEY.**—April 14.—For erection of stable and alterations to cottage in High Street. Mr. T. A. Buttery, architect, Queen Street, Morley.

**MOUNTAIN ASH.**—April 12.—For building workmen's hall and institute. Alderman William Jones, Oakwood, Aberfrwd Road, Mountain Ash.

**NEWQUAY.**—April 30.—For erection of the Headland Hotel. Mr. Silvanus Tremain, Truro.

**NORTH ORMESBY.**—April 12.—For enlargement of store, High Street. Mr. Robert Moore, architect, 7 Albert Road, Middlesbrough.

**NOTTINGHAM.**—For erection of villa residence. Mr. H. Sulley, architect, Albert Chambers, Albert Street, Nottingham.

**OBAN.**—April 15.—For municipal buildings. Mr. Alexander Shairp, architect, Oban.

**PADDINGTON.**—April 13.—For erection of casual wards in Woodfield Road, Harrow Road. Mr. F. J. Smith, architect, 17B Great George Street, Westminster.

**REDDITCH.**—April 15.—For erection of Baptist church, also for schools and classrooms. Mr. E. A. Hodges, 1 Evesham Street, Redditch.

T. DAVIDSON, Parton, Whitehaven (accepted) .£404 19 7

## BUILDING AND BUILDERS.

A CHAPEL is to be erected at Burley, the cost of which is estimated at 6,000l.

THE memorial-stone of the new senior Public School for West Calder was made the occasion of an imposing ceremony. The stone was laid on the 2nd inst. The school, which has been erected to meet the growing requirements of the district, is estimated to cost about 5,000l., and will accommodate 460 scholars, and have a hall for the tuition of secondary education. It is situated to the south-west of the village, and is in proximity to the junior school.

THE interesting old church at Austerfield is to be forthwith restored. The quaint old fabric, near Bawtry, Yorks, not only bears traces of great antiquity, but is in some sense an historical landmark. Here was baptized William Bradford, "the first American citizen of the English race who bore rule by free choice of his brethren." The Norman font at which the holy rite was performed 300 years ago may still be seen, and the parish register shows the original record of that event. It is

not a large amount that American sympathisers have so far subscribed to the fund, but it appears there is a prospect of a substantial sum being raised in Massachusetts and elsewhere if Bradford's descendants are permitted to erect a brass plate in the church to the memory of the renowned Governor. The authorities have gladly given that permission. The work of renovation is estimated at about 1,550l., towards which something like 1,150l. has been either subscribed or promised, including a sum of 38l. from America. The cost of the north aisle would be probably about 250l.

## TRADE NOTES.

THE special train which is being built by the Great Western Railway Company, to convey the Queen from Windsor to London on the occasion of the Diamond Jubilee proceedings, is so far completed as to be ready to receive the internal fittings, and we understand that the Longford Wire, Iron and Steel Company, Limited, have been honoured with instructions to construct the whole of the seating of the coaches, on the Wood's patent galvanised woven-wire principle.

THE new Board schools, Loughborough, are being warmed and ventilated by means of Shorland's patent Manchester grates, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

MR. FREDERICK BRITTON, builder and contractor, late of Leconfield Road, N., has removed to larger and more commodious premises at 469 Caledonian Road, N.

## VARIETIES.

A NEW post-office has been opened at Aberfeldy.

AN additional doorway is to be constructed to give access to the terrace from the House of Commons, to supplement the present one, which in the season often proves inadequate.

THE new station at Kelvinside, in the west end of Glasgow, in connection with the Lanarkshire and Dumbartonshire and Central Railways, was opened for passenger traffic on the 1st inst.

THE memorial window which it was proposed to erect to Oliver Goldsmith in the church near "Sweet Auburn" has

been subscribed for mostly, we note, by literary men, and the necessary work has been put in hand.

WHILE excavating in Silent Street, Ipswich, in order to lay down new water-pipes, some workmen found the bones of seven men. The skulls were in excellent preservation and as hard as flint, but the remaining portions of the skeletons broke during disinterment. The site of the discovery is near where the old priory stood, and Cardinal Wolsey is said to have lived there.

New premises, comprising a chapel, hall and a number of commodious rooms, have just been opened by the Unitarian London Domestic Mission in Bell Street, West Marylebone, for the mission until recently successfully carried on in Capland Street. The organ, which was the property of Professor Stanley Jevons, has been presented by his widow. The removal from Capland Street took place owing to the premises being required for railway extension.

THE new ostrich house which has recently been erected at the Zoological Gardens, if not quite so ornate as some of the other houses, is nevertheless a somewhat imposing structure some 164 feet in length, with a central tower 30 feet high. The cages have a long paddock attached to each, and a special warming apparatus, by means of which the temperature in the various cages can be regulated to suit the requirements of their various tenants. The building has cost 4,000*l*.

THE new jetty at the entrance to the Prince's Dock, Liverpool, was opened for traffic on the 2nd inst. The first vessel to make use of it was the Belfast steamer *Optic*, from which a large number of horses intended for the French army were landed. The passengers disembarked at the jetty, and the cargo was also discharged there, aided by the powerful cranes on the new piece of work. Everything worked extremely satisfactorily, and the great advantage the jetty will prove in relieving the congestion on the Prince's Landing-stage was amply demonstrated by the fact that at the time the *Optic* was landing her passengers, live stock and cargo, the Cunard liner *Campania* was alongside the stage disembarking her passengers from New York.

THE "Municipal Year Book" for 1897—a new annual—will be published in the course of a few days. The object of the book is to describe the municipal work in the towns of the United Kingdom. Besides general sketches of local government in all the larger towns, it contains statistics and information concerning public baths, free public libraries, municipal

markets, technical education, public slaughter-houses, &c., while the more important municipal undertakings, the supply of water, gas, electric light, the management of tramways and the erection of artisans' dwellings receive special treatment in separate sections. Statistics regarding rates and the cost of local expenditure, as well as much other information concerning municipal institutions, are included. The revision of the proof-sheets, as regards the facts and statistics, by the town clerks throughout the country has caused this, the first issue of the Year Book, to be somewhat late, but has insured accuracy, which is essential in a reference book of this character. An introductory chapter reviews the enormous development in municipal government which has taken place during the Queen's reign. The book is the work of Mr. Robert Donald, the editor of *London*, and is published at the office of that journal. It contains over 450 pages, and the price is 2*s*. 6*d*.

KILRUSH HOUSE, one of the finest mansions in co. Clare, was almost entirely destroyed by fire on the night of the 26th ult., the only portion which remains being the billiard-room. The place was in charge of a housekeeper and housemaid, as the Vandeleur family, who own Kiltrush House, are at present living at their London residence in Cadogan Square, S.W. Scarcely a piece of the costly furniture or one of the many heirlooms was saved from the general destruction. The building was insured for 1,980*l*., but no insurance was effected on the plate, library or general contents of the mansion.

At a special meeting of the Paisley Town Council the following contracts for electric lighting were agreed to:—Babcock & Wilcox to supply boilers, 2,415*l*.; Messrs. Callender, London, cables, 6,154*l*.; Ferranti, Limited, London, steam alternators, switch-gear, rectifiers and transformers, 10,603*l*. 10*s*. This installation is for the central area of Paisley, and is to be erected in five and a half months. The Council have borrowing powers for 35,000*l*. for the extended scheme.

### ELECTRIC NOTES.

PROFESSOR FORBES, the electrician, after a visit to Wady Halfa, expresses a highly favourable opinion about utilising the power of the cataracts for generating electricity, and considers the general circumstances of Egypt exceptionally well adapted for its use as motive power.

A new electric lighting scheme has been sanctioned by the Aberdeen Corporation for increasing the capacity of the electricity mains to the extent of 20,000 lamps. The extension, which has been adopted on the recommendation of Professor Kennedy, will cost 3,754*l*.

At a recent meeting of the Worcester Council, the mayor (Mr. W. C. Dyson Perrins) presiding, the report of the electrical engineer upon the past year's work was considered, and his recommendations were adopted. They include the expenditure of upwards of 9,000*l*. upon additional plant at the generating station at Powick, and an alteration of the system of payment from 5*d*. per unit to 6*d*. per unit for the first hour's daily average use, and 2½*d*. per unit for all current consumed in excess of this amount.

### NEW CATALOGUES.

MESSRS. NOYES & CO., of 76 Old Street, E.C., are sending out their new catalogue, and may be complimented on the manner in which they have got it up and its general all-round completeness. It contains nearly 300 pages, all of which have

Wrought Iron.

Cast Iron.

numerous illustrations of the various specialties of the firm, comprising building and sanitary ironwork of every description. The wall ties, for bonding hollow walls, deserve special men-

tion. These are made both in wrought and cast-iron, and in various shapes, weights and sizes. The sketches show one of each kind, and they are supplied either galvanised or coated with Dr. Angus Smith's solution. For special jobs they can also be made in copper. Any pattern can be made to order, or any of the stock patterns can be altered as required. Another of their specialties is their "everlasting" patent file and chisel handles,

which are made of a specially prepared pulp and are soft and comfortable to the touch, will not split, and the ferrules of which cannot fall off. They are durable, and, moreover, inexpensive. That they are slightly will be seen from the larger

sketch, which shows the handle's actual size, and the smaller one shows a handle subjected to a severe test of its toughness.

MESSRS. LUMBY, SON & WOOD, of Halifax, have sent us their new list of specialties for 1897, among which special prominence is given to their new "Southern" boiler with 6-inch waterway, fitted with three mudholes and bridges for the easy removal of incrustation without disturbing the brickwork; a useful boiler for supplying hot water and for heating purposes in districts where the water contains a large amount of lime, &c. The waterway is extended 6 inches below the fire-doors, thus allowing the sediment to fall below the fire, where it is not liable to cause damage to the boiler. "Edge's Patent Saddle Boiler," which is particularly suitable for situations where depth of stoke hole does not admit of many other forms of boiler. The shape of the boiler is such as enables it to stand a greater amount of pressure than the ordinary saddle boiler would be capable of doing. The "Marlor" boiler, the design of which is entirely new and original, combines points of merit and utility which at once stamp it one of the most efficient and economical boilers in the market. Any sediment contained in the water falls below the fire bars, where it cannot injure the boiler, and is collected by the special shaped bottom, which together with the draw-off arrangement attached to the same (which is of large size), enables the boiler to be flushed out daily if required, and if this is done regularly when the boiler is new, the liability of failure from the deposit of sediment is greatly reduced. The "Standard" dome-top boiler, with new registered doors, slide ventilators to fire and ashes doors, patent nickeled non-radiating handles which never get hot. The "Twelve Hours" boiler, the "Caloni" double cylinder boiler and the "Majestic" steam heater are arranged with vertical and drop flue tubes, which in actual use have been proved to be very efficient and economical. The fuel space and steam space are ample, and the arrangement of chimney enables a large fire to be quickly lighted. The dampers and automatic arrangement can be regulated so that the minimum amount of attention is required. Messrs. Lumby, Son & Wood have made the question of low-pressure steam heating a practical study, and are now constructing a number of boilers for this purpose. They make a large number of calorifers or steam heaters with coils, and also with iron, steel or copper tubes, and their patent round manhole cover has proved itself most successful. The safes manufactured by the firm have recently undergone revision in construction, so as to keep pace with modern requirements, and are now well up to date.

## COMPLIMENTARY DINNER TO THE MANAGERS OF THE BUILDING TRADES EXHIBITION.

AT the close of the recent Building Trades Exhibition, held at the Agricultural Hall, it was felt by many exhibitors that it would be fitting to testify in some way the high appreciation in which the services of the gentlemen who were primarily the promoters of the display, Messrs. H. Greville Montgomery and A. M. Callender, were held. A meeting of exhibitors was accordingly convened, at which it was decided to give a complimentary dinner to these gentlemen, to be held at the Midland Grand Hotel, St. Pancras, on Wednesday evening, April 7, and a committee of five was appointed to make the arrangements—viz. Mr. C. J. Bailey (Messrs. G. S. Key & Co., Limited), Mr. H. J. Harding (Messrs. W. H. Martin & Co.), Mr. G. Marlow Reed (Messrs. John Knowles & Co.), Mr. W. Ward (Granite Plaster Company) and Mr. W. A. Cameron Waller (Waller's Grip-fast Tile Company).

Some forty to fifty gentlemen connected with the building trades sat down to an excellent dinner in the Venetian Room at the Grand Midland Hotel on Wednesday evening last. Mr. W. Ward occupied the chair, being supported on his right and left by the guests of the evening. Among those present were Messrs. John P. Seddon, F.R.I.B.A., Harold Rathbone, C. J. Bailey Broad, E. T. Chaplin, G. Davenport, H. Heyman, Mark Gentry, H. J. Harding, E. Holwill, W. H. Marlin, P. A. Randall, G. Marlow-Reed, Lawrence, Seager, H. B. Tarry, G. Tucker, H. Turner, W. A. Cameron Waller, P. A. Gilbert Wood (*The Architect*), &c. The after-dinner proceedings were informal in character, the speeches being commendably brief and varied with sentimental and humorous songs. The remarks led up to a discussion on the practicability and desirability of seeking to establish a builders' exchange for London.

When the royal toast had been honoured, the Chairman then gave the toast of the evening. He remarked that he had the pleasure of seeing around the table a large body of gentlemen connected with the most important industry in the kingdom, and he thought that their honoured guests, Messrs. Montgomery and Callender, ought to feel very proud that such a numerous and representative gathering had come together of those who had taken part in the recent Building Trades Exhibition. This banquet was a gratifying testimonial to the success of that exhibition. Personally he should have wished to have seen still more of the exhibitors present; but at the same time they must bear in mind that they were scattered far and

## LONDON AND GENERAL WATER PURIFYING COMPANY'S, LIMITED,

PATENT CISTERN FILTERS, Charged Solely with Animal Charcoal. Requiring, when once fixed, NO attention whatever, and superior to any others. Vide Professor Frankland's Reports to the Registrar-General, July 1866, November 1867, and May 1870. The *Lancet*, January 12, 1867.

Also, Testimonials from Dr. Hassall, September 23, 1863; the late Dr. Letheby, February 15, 1865, and December 1872. Price, £1 10s. and upwards. Portable Filters on this System, £1 5s. to £3.

Patronised and used by Her Majesty the Queen at Osborne, by H.R.H. the Prince of Wales at Sandringham, by H.R.H. the Duke of Edinburgh at Eastwell, by H.R.H. the Duke of Connaught at Bagshot Park, by H.R.H. the Duke of Cambridge, the *élite* of the Medical Profession, and at the London, Middlesex, St. George's, St. Mary's, Consumption, Fever, and German Hospitals, and various Lunatic Asylums, Institutions, Breweries, &c., and at all the Schools established by the School Board for London. Pocket Filters, 4s. 6d. and 6s. each. Household and Fancy Filters, from 10s. Water-testing Apparatus for detecting impurities in Water 10s. 6d. and 12s. each.

157 STRAND, W.C. (Four Doors from Somerset House), LONDON.

wide all over the kingdom. He had sent out over 240 invitations for that evening, and had received responses from nearly everybody, and the majority of those who were not able to be present had wished him to convey to their guests their high appreciation of the excellent way in which they had conducted the exhibition. A number of gentlemen who were not present had asked to be allowed to contribute towards the musical, printing and other expenses of the evening. As an exhibitor himself, he went into the display at the Agricultural Hall in a business-like manner, and if all present had reaped the same success as he had enjoyed, they would drink to the continued health and success of Messrs. Montgomery and Callender with the utmost heartiness. It was one thing, as they all recognised, to render an exhibition financially profitable as a show, and quite another matter to make it a success from the exhibitors' point of view, and as this touched the interests of all, they ought to appreciate the excellent and most satisfactory manner in which it had been accomplished. There had been a marked absence of the side shows and outside exhibits which had so greatly impaired the unity and business-like character of previous exhibitions, and he would ask them to drink very heartily to the good health and continued prosperity of their guests.

Mr. Broad, in supporting the toast, said he had had considerable experience of exhibitions, but he had never seen one conducted with so much (might he use the vulgar word?) "class" as the one that had just closed. Everyone would recognise that Messrs. Montgomery & Callender had elevated the exhibition into something more than a mere money-making display, and they had indeed done their level best to make it thoroughly satisfactory to all connected with the building trades. Such a venture had involved an enormous amount of labour, and must have been attended with some disappointments and anxieties; but, judging by its results, they could not say too much of the way in which it had been conducted. He could not sit down without referring to the action of these gentlemen in organising the clay-working industry. This movement was started on a modest scale a very few years ago, and had been the means of welding together the entire trade, while the Journal was of great service to the members. On one point he feared that he differed from Mr. Montgomery, and that was on the frequency with which such exhibitions should be repeated. Because it was so great a success, it ought not, he strongly felt, to be held too often. That was one of the causes which led to the failure of previous enterprises of the kind.

The toast having been drunk with musical honours, Mr. Montgomery responded. He said he felt somewhat in a position of a member of Parliament who had been returned about a week and was asked to come down and address his constituents. He could only say he was obliged to them for electing him; that he should continue to endeavour to retain their confidence, and wished to keep his seat as long as possible. He was, as they all recognised, a Radical, and was ever on the look-out for means of securing further improvements. There was no such thing as finality in exhibitions, but he was conservative enough to wish to retain all his constituents. It had been a great pleasure to Mr. Callender and himself to see that their efforts had been so successful. They had not heard a single complaint from any exhibitor that they had not kept their promises, nor had any said that they were disgusted with the arrangements, and many who had come to scoff had remained to pray. There had been a certain number of objections raised; but these came not from the exhibitors, but from a section of the Press who had ever treated them most unfairly, and had damned them with faint praise. They had been told that the policy of holding the exhibitions in alternate years was wrong, and that they ought only to take place every five years. That would be absurd, for if the present management decided not to engage the Agricultural Hall for five years, they might depend upon it a syndicate of Jews would spring up who would run a show simply for the gate-money, with the failure as in the case of two previous managers. The same critics told them that they ought only to show novelties; but if the exhibition were only opened once in five years, it was clear that many things which were new inventions in the earlier years after the show closed would cease to be such before the doors were again opened. The fact was, the exhibition had to be run on business principles, and when this was done, architects, surveyors and others were there to see what was going on. So long as architects, builders, builders' merchants, and others specially interested visited the exhibition and took notes of what was there to be seen, he was well satisfied. It had been said that the exhibition was not sufficiently advertised. He had his own ideas about that point; but he would tell them what they had done. They distributed and caused to be exhibited 3,000 large bills, and issued over 6,000 invitations to architects, municipal engineers and surveyors, builders' merchants and builders. After the success of the exhibition was certain, he might say that they expended over 200% more in making assurance doubly sure. They could easily have packed the hall

with the general public, but not one-tenth of the amount of business would then have been done.

Mr. Callender also briefly responded, observing that it was a very great pleasure to meet again, under such happy circumstances, so many of the people with whom they had associated at the Agricultural Hall; to feel that those whom they had to meet in business relations had become old friends who appreciated their efforts to render the exhibition a mutual success. As Mr. Montgomery had indicated, they had done a great deal of work which did not show prominently—preliminary labour which extended over not weeks merely, but many months. The credit of organising and carrying it through was due to Mr. Montgomery; as for himself, he was merely the "calendar" for the year, and he trusted that they would exhibit as satisfactory a "calendar" for 1898 or 1899, and that whenever they reopened a building trades display, the exhibitors would be animated by the same kindly feelings that they had evinced that evening.

Mr. G. Marlow Reed proposed "Prosperity to the Building Trades of England," and coupled with it the name of Mr. W. A. Cameron Waller, remarking that, while his firm had to do with the drain-pipes, his friend dealt with the roofs of buildings. He urged that masters of the building trades should bear in mind that when they harmed one another they injured themselves; it was better for everyone that they should work harmoniously together, and not to go for each other's lives, and such a gathering as that tended to promote this good feeling and mutual sympathy.

Mr. W. A. Cameron Waller, in response, said the recent successful Building Trades Exhibition had been the means of bringing together those who were competitors. He wished to make a suggestion that had long been on his mind, and that was that the time had come for the formation of a Builders' Exchange for London. As many of them were aware, there was a flourishing Builders' Exchange in Glasgow, and the same idea had just been taken up in Edinburgh. London might justly claim to be the most important city in the kingdom, and surely if these could be made successful (undertakings in the Northern cities), there was room for such a movement in London. Not only so, but the timber and iron trades already had their Metropolitan exchanges, and it seemed a strange thing that there was nothing of the kind in London for the representatives of bricks and mortar. He should like to hear the opinions of others on the subject, and would promise that if the idea were adopted he would render all the support in his power.

In reply to a call from the Chairman, Mr. Montgomery said the suggestion of a Builders' Exchange for London was by no means a novel idea to him, for the formation of such a body had been proposed a good many times of late years, but so far the scheme had not taken any tangible form. The Institute of Clayworkers, to which Mr. Broad had alluded in such appreciative terms, had thus far proved a great success; in its offices they had provided a museum, where architects could freely inspect the various products of different districts, and could inform themselves where a particular kind of brick could be obtained. If such a Builders' Exchange were established in the Metropolis, it would have to be done on a very large scale, or it would not be worth while to undertake it. The promoters of such an Exchange would have to face the problem of the provision of a building sufficiently central, and of the size and importance which such an undertaking would merit; but should such a scheme be organised, he would do his utmost to support it.

The Chairman said similar Builders' Exchanges had been established in New York, Pittsburgh and Chicago, and if Glasgow and Edinburgh could support such institutions he could not see why it should not successfully be carried out in London. It meant, of course, buying a considerable property, for not only offices and conference rooms, but an enormous amount of space would be required for exhibits. The idea was, however, a good one, and should it commend itself to the trades he knew of no one better able to carry it out than Messrs. Montgomery and Callender.

Mr. Mark Gentry suggested that the co-operation and financial support of some of the City Companies should be sought in working such a scheme.

Mr. Broad said the question had occupied his attention for years. He thought it was most desirable that the various trades connected with building should be brought together in one institution to work in co-operation, for although they were competitors, their interests were identical. As had been hinted, if carried out, such an exchange must be a very big affair. It needed to be backed up and energetically pushed forward by some one who was head and shoulders above any suspicion, and who would not arouse the jealousy of any one trade. They had founded of later years associations of clayworkers, lime merchants and brickmakers, besides plasterers and other trades, and why could not all be amalgamated and fused into one body representing the largest industry in Great Britain? If Messrs. Montgomery and Callender would take the matter in hand, he was convinced that this would be done,

and the exchange would become an accomplished fact—one that must be of use and benefit to all.

Mr. John P. Seddon said if the exchange was to succeed there must be no selfishness or jealousy manifested. From the architect's standpoint, he thought it might be workable, but the arts of building must not exhibit the jealousy that was too often to be found in art.

Mr. Harold Rathbone thought the proposals as sketched out were on too large a scale, and would impose too heavy a responsibility, financial and otherwise, on the initiators. The idea was excellent, but he would urge that they inaugurate the movement in a modest and elemental character, and further, that from the very first the aim should be to render it self-supporting. If possible branch offices should be formed in various districts, claiming London as their centre.

Mr. Callender said he was told at Glasgow that a local builders' exchange was very well in its way, but it ought to be centred in London. If it was left to provincial cities to organise such a movement no good would be done, but if the Metropolis took the lead they would follow.

Mr. Heyman also supported the proposal, but pleaded, amid some laughter, that it should be established on an international basis. We exported more building manufactures abroad than we received, and when it was remembered how largely Lincrusta Walton was used in his native land, there ought not to be prejudice evinced against goods simply because, like himself, they had been "made in Germany."

Mr. P. A. Gilbert Wood said the proposal to found a Builders' Exchange was one that demanded grave consideration of ways and means before being adopted; but if it were decided upon by the trades, it must be carried into effect with a vigorous will and a determination to make it a success.

The closing toast was "The Chairman," proposed by Mr. Percy A. Randall, and in replying, he said while this gathering had primarily been intended as a compliment to the promoters of the exhibition, it had promoted good fellowship among exhibitors and had led to a practical discussion that he hoped would eventuate in the establishment of a Builders' Exchange.

Before leaving the party united in singing "Auld Lang Syne" and the National Anthem.

MRS. MATTHEW GRAY has undertaken to erect a church in West Hartlepool at a cost of 12,000/., as a memorial of her late husband and of the Queen's reign.

## SOUTHEND PIER.

A DISPUTE has been pending in the High Court of Justice for some time between Messrs. Murdoch & Cameron, Limited, of London and Glasgow, engineers and contractors for public works, and the Corporation of Southend-on-Sea, over the erection of a promenade pier there, the contract price of which is about 20,000/., and in consequence work has been suspended during the last five or six weeks. Sir William Arrol, M.P., of Forth Bridge, Tay Bridge and Tower Bridge fame, with Mr. John Waugh, C.E., and Mr. William Jaffrey, M.I.C.E., having visited and inspected the pier and reported favourably as to the state of the work and the probability of the pier being ready for the ensuing season's traffic, terms have been arranged between the Corporation and the contractors, who are to receive 2,000/., bonus in addition to their original contract price. The action has been taken out of Court, and work on the pier has been resumed under the direction of Mr. John Wolfe Barry, C.B., the newly-appointed engineer to the Corporation.

## ELECTRIC LIFTS AND CRANES.

At the ordinary meeting of the Institution of Civil Engineers on Tuesday, March 30, Mr. John Wolfe Barry, C.B., F.R.S., the president, in the chair, the paper read was "Electric Lifts and Cranes," by Mr. Henry W. Ravenshaw, Assoc. M.Inst.C.E.

This communication referred to the application of the electric motor to the working of lifts and cranes. Where hydraulic power was available, its simplicity afforded many advantages, although in the ordinary form of hydraulic motor as great an amount of water was used with a light load as with a heavy one. The electric motor, however, only absorbed current in proportion to the work developed, and this fact alone justified its application in certain cases. The chief requirements of the motor were sparkless commutation, self-adjusting brushes and automatic lubrication. Shunt machines were generally used on account of their regular speed with varying loads; a few turns of series winding were, however, sometimes added to give prompt starting. Worm-gearing was employed, and gave compactness and silent running, with a quick pitch for the worm; ball-bearings and an oil bath were recommended. To

give good results, however, the ball-races must be of high-class steel, and be ground perfectly true after hardening. A special form of rope-drum made by Messrs. Easton, Anderson & Gooldeen, Limited, and the Sprague screw elevator with ball-nut were described.

The regulating-gear should provide prompt and accurate control, absence of jerks, small current consumption and regular speed. Resistance was necessary in the circuit of the motor at starting to prevent a great rush of current; and this should be controlled automatically, as it was impossible for the attendant to tell the position of the switch when a hand-rope was used. The automatic controller used by the Otis Company was described, as well as an arrangement controlled by a centrifugal governor which had been designed and used by the author. Magnetic brakes were advocated, the cage being automatically stopped when the current was accidentally broken. The magnet should be fitted with non-conductive resistances to prevent sparking on breaking the circuit. Tests of an Otis elevator and a curve showing the energy consumed under varying loads were given, the cost per return trip with four persons to a height of 36.5 feet being 0.101 pence at 4d. per Board of Trade unit. The cost of an average trip with two persons to a height of 24.75 feet was 0.060 pence at 4d. per unit.

Electric cranes presented several marked advantages over those driven mechanically, owing to the flexibility of the control of the motor and the simplicity of the conductors for transmitting the power. The relative advantages of the use of a separate motor for each motion, and of a single motor and friction-clutches were discussed, the mechanical simplicity in the one case and the electrical simplicity in the other enabling either system to be used with good results. Tests were given of a 20-ton electric crane, at Woolwich Arsenal, arranged on the single motor principle, friction-clutches being used to actuate the various movements. The collectors for the current with the method used for insulating them were described. Owing to the special requirements of this crane much gearing was necessary, and a heavy chain-block weighing nearly 2 tons was fitted. The efficiency was thus reduced, especially at light loads, and the horse-power delivered to the load, as well as that delivered to the block, was given to enable the mechanical losses to be more readily obtained. A total efficiency of 53.42 per cent. was obtained when the load on the hook only was considered, and of 58.28 per cent. when the weight of the block was included in the load. To drive the outer carriage

at the rate of 54 feet per minute 8.4 electrical horse-power was required, and 10.2 electrical horse-power to traverse the load radially at the rate of 32.4 feet per minute, both with a load of 20 tons.

The paper was illustrated by drawings of the lifts and cranes described.

### THE COUNTY COUNCIL WORKS DEPARTMENT.

THE special committee of the London County Council that was appointed to inquire into the management and financial position of the Works Department since its inception and as to its future prospects have completed their report, which was presented at the meeting on Tuesday, the 6th inst.

The report contains an extract from the statement of Mr. Waterhouse, one of the assessors, who considered the best means of avoiding in the future any recurrence of such falsification of accounts as that which led to the inquiry. Mr. Waterhouse says:—

"The total amount of the fabricated entries, as stated by the comptroller in his report, amounted to 7,229l. 11s. 10d. None of the cash outlay of the department, except the petty cash and the wages, the payment of which is entrusted to guaranteed pay clerks, is in the hands of officers of the Works Department, and these entries had no reference to any misappropriation of money, nor did they conceal any action whereby any employé of the department was pecuniarily advantaged. They resulted simply in a false statement as to the cost of various works, the apparent cost of some being decreased by amounts which were included in the cost of others. It is for me to point out any defects in the office arrangements which rendered the fabrication of these vouchers and entries possible, and prevented their immediate detection. It may be well, however, here to refer to the evidence of Mr. Fullwood. The allegations with regard to false entries in the books contained in his letter to Mr. White of November 21, 1896, were, in cross-examination, found to relate to some entries—of which he instanced two for amounts of 1l. 2s. 9d. and 1l. 3s. 1d. occurring in the month of June, 1893—in the books of his own department of gasfitting, in respect of foremen's time, which he said was evidently false, inasmuch as no foremen were employed. I find that these entries were posted from the time-sheets in the same way as all other wages, and that the amount represented a proportion of the wages of the foremen engaged in generally superintending

the work at some lodging-houses of which some gasfittings under Mr. Fullwood formed some part. There does not appear to have been in this case any attempt or intention to misrepresent facts."

The committee say they have nothing to add to the remarks in Mr. Waterhouse's report. They concur with the recommendation of both the assessors—that, with a view to preventing similar practices in the future, the bookkeeper should be independent of the manager.

It is admitted that the department was from the first connected with the labour policy of the Council. The committee also say that after a careful review of the operations of the works committee in comparison with the practice of provincial municipalities and railway companies, while it seems probable that the execution of works without the intervention of a contractor prevails in regard to municipal bodies and railway companies to a degree much larger than is generally supposed, the tendency to dispense with or even to abolish the contracting system altogether has been much stronger in the London County Council than in any case that has come under their notice. The department was formed in circumstances of great exigency and disadvantage, and while there had been considerable conflict as to the cost of this and that particular work, they think it safer to form an opinion upon the general operations and upon the statements of all parties, both opponents and admirers of the department, than to enter upon any minute examination of the outcome of each particular operation. The experience of the Council, the practice of other municipal bodies, of railway companies and of large manufacturers and estate proprietors, had led them to a firm conviction that some definite organisation for the direct employment of labour and the direct execution of public works by the Council under the superintendence of its own officers was desirable and beneficial. This opinion brought them to the special matters of difference between the policy of the Council and that of provincial municipalities in regard to this subject, which were perhaps most prominently to be found in connection with the central works in Belvedere Road. There the Council had acquired and improved a wharf which was probably worth 50,000*l.*, and had expended in the erection of offices, clerks' offices, workshops, stables, &c., about as much more. The works committee had accumulated there and in other dépôts plant and stock and stores, which, together with working capital, made a total investment of about 170,000*l.*, the stock of timber alone amounting to about 20,000*l.* The committee think that such offices are not necessary for the

construction of sewers or for laying down foundations, but they are a necessary equipment when the Council have to be prepared to undertake the erection of workmen's dwellings upon sites cleared under the Housing of the Working Classes Act, the jobbing works in all parts of London, and the erection of architectural buildings in connection with the various obligations of the Council. Even if the operations of the Works Department were limited to engineering works the Council would still require a central station and works and dépôts of some description. These central offices, of course, involved a standing charge of considerable magnitude, which could only be reimbursed by the profitable undertaking of public works, and they had received estimates varying from 200,000*l.* to 250,000*l.* of the amount of the gross value of work necessary to keep these central offices in profitable occupation. The possession of these offices gave to the Council in the execution of architectural works an independence with regard to contractors which could not be obtained in any other way.

After stating that inquiries made of the larger corporations tended to show that work of a structural character was carried out, as a rule, by contractors, the committee say that in the business of the Council, except for machinery or wrought-iron or steel-work, the intervention of a contractor had been practically discarded in the engineering department, and the evidence they received was not unfavourable to a continuance of that system. The cases in which the department had executed works most largely within the respective estimates had been of that character. There was much more contention as to the dealing of the department with architectural construction, but there was no substantial remarkable difference of opinion as to the general quality and character of the work. Upon this subject the committee say:—

"There has been excess of cost, but we are unable to say that in the aggregate this would not have been far greater had the Council been left to deal only with those contractors who would accept their terms and conditions of contract. Latterly, with a more settled plan of operation, the Works Department has been more successful, and in regard to recent works, even of architectural character, the good quality has been maintained, and the cost does not appear to have been in excess of that which would have been paid to a contractor. A period of at least two years was necessary for the economic arrangement of such a new department. In architectural work there is not the same risk to be insured against as in the underground operations of engineering work; there is not the same

uncertainty with regard to estimates nor the same margin of possible profit. It is unlikely that architectural buildings will, owing to the numerous details and intricacies, be executed by a Works Department at less than the prime cost to a contractor; but, on the whole, it appears that the Works Department can execute architectural works of equal quality, without loss, and with no greater charge than the Council would pay to contractors. This inquiry has not, however, led us to believe that the full average of builders' profit upon architectural work can be obtained by the direct employment of labour, though there can be no doubt that the power of the employer to do the work himself is a valuable check upon builders who might otherwise think the employer was wholly in their hands."

The committee concur in the general opinion of witnesses that there should be no universal exclusion of the contractor. With reference to the form of contract which states that contractors shall pay the wages "in practice obtained by the various trade unions in London," they consider that the objection of contractors to those words can be removed by inserting a mention of the unions of employers where such exist, and the extent to which such exist, together with the trade unions which are exclusively organisations of workmen. The committee cannot see their way to recommending any alteration of the standing orders, such as would be required to admit of competition in tendering between the department and contractors. Nor do they recommend the making of a selected list of contractors or the abandonment of the customary mode of open tendering. They regard the employment of contractors as beneficial if considered only as strengthening the resources of the Council for the undertaking of public works and keeping the officials concerned in the preparation of estimates and supervision of works closely in touch with the prices of work and of materials. They think it advisable that the works manager should never be overloaded, and that, especially as to architectural works, whenever he is sufficiently occupied tenders should be invited. If there were two works of a similar nature to be executed, there would be advantage by way of comparison in giving one to the works manager and the other to a contractor. The committee do not think any alteration should be made in the present system of executing jobbing works, at all events for another year, and that then there should be a further report upon its operation and results. The present system is that if the work is small it is done by some one sent from the central offices; but if it is considerable it is carried out by local labour collected on the spot.

Generally, as to the future of the department, the committee say:—

"No witness that has appeared before us has advocated the abolition of the Works Department. On the contrary, even those who have criticised the work of that department most keenly have, at the same time, advised its retention. One witness stated that he did not propose to abolish the Works Department, that he thought the department was a very useful provision for the Council to have at its disposal; that he thought there were a large number of works that could be done quite as well by the Council as by a contractor, but that he was not certain that building works could be included in that list. Another witness said that he would not contemplate abolishing the Works Department as a department, and that in his opinion it was better that it should be a separate department. With reference, however, to the works committee, there has appeared a general concurrence of opinion as to its unsatisfactory constitution. Under the standing order of the Council this committee consists of from sixteen to twenty members, with three *ex-officio* members, making twenty-three in all. We have had suggestions for the reduction and for abolition of this committee. The chairman thinks it too large, and that the method of selection is thoroughly bad. He describes it as composed of ten members sympathetic toward its work and ten members whom he describes as "not so sympathetic." He says it is equivalent to partners in business who do not agree, with the result that their business does not succeed. The subject appears in the evidence in many different forms, and in view of its importance we have given it the fullest possible consideration. Our conclusion is that it is for many reasons expedient that fresh arrangements should be made."

After a brief reference to some of their proposed alterations, the committee conclude by stating that they have received a memorandum from four members of the committee which under the special circumstances attending the appointment of the committee they think should be presented as an appendix.

The following are the committee's recommendations:—

"(a) That in the opinion of the Council some definite organisation for the direct employment of labour and the direct execution of public works by the Council under the superintendence of its own officers is desirable and beneficial.

"(b) That a works board be substituted for the works committee, such board to be elected forthwith, one member to be nominated by and from each of the following committees:—

CASES for BINDING THE ARCHITECT  
Price 2s.—Office: 175 Strand, London, W.C

Financé, asylums, bridges, fire brigade, highways, improvements, main drainage, parks and housing of the working classes; and that in future years the election of members of the board do take place at the meeting of these committees next to March 31.

"(c) That any committee desiring to propose to the Council the carrying out of any works without the intervention of a contractor shall, in the first instance, obtain an estimate from the proper officer, and then refer such estimate to the works board for their consideration before reporting to the Council.

"(d) That the works manager shall, unless in any case otherwise ordered, carry into execution all works which the Council resolves to execute without the intervention of a contractor.

"(e) That when the Council wishes to execute any works without the intervention of a contractor the plans, specification and estimate shall, unless otherwise ordered by the Council, be thereupon referred to the works manager.

"(f) That the works manager shall be responsible to the works board, and the board shall report from time to time to the Council.

"(g) That this report be referred to the general purposes committee, and that it be an instruction to that committee to amend the standing orders in accordance with the foregoing recommendations.

"(h) That it be referred to the general purposes committee to make further amendment of the standing orders by the insertion of words coupling the unions of employers where such exist with the trade unions, in reference to the rates of wages and hours of labour.

"(i) That it be referred to the general purposes committee to make further amendment of the standing orders by omitting provisions giving powers to the Clerk of the Council to direct examination of the books of anyone contracting with the Council for the execution of works other than the time-sheets or books, or wages-sheets or books.

"(j) That the statement of Mr. Edwin Waterhouse be referred to the comptroller for report upon each and all of his suggestions with reference to the accounts, and that the comptroller's report be referred to the general purposes committee with a view to the adoption of Mr. Waterhouse's recommendations."

#### Report of Minority.

A report signed by Messrs. Beachcroft, Fletcher, Longstaff and Sir Godfrey Lushington is also submitted. They say that,

as it is certain the Council will need to have recourse to contractors, it is to the interest of the ratepayers that the best class of contractors should be induced to come forward. They therefore recommend that an early opportunity should be taken to revise the standing orders which prescribe the form of contracts, so as to get rid of anything which could be interpreted by contractors as indicating a spirit of unjustifiable distrust, or as placing them in a humiliating position. In particular they are strongly in favour of the Council reserving to itself freedom either to direct the tendering to be open, or to confine it to selected firms, as may seem expedient. They trust that by the exercise of this discretion the Council may give a full trial to the system of limited tendering, and, if it is found to answer, may adopt it as the general, though not necessarily the invariable, procedure in putting works out to contract. Upon the subject of the cost of estimated works the minority say:—

"The question of cost is not whether the Works Department might have executed the works more economically than they have done, but whether it is cheaper to the Council to employ the Works Department than to have recourse to contractors. The theory of the Council executing its own work is that the Works Department, if it can work as cheaply as a contractor, will save to the Council the whole of the contractors' profit, whatever that may be; and even if it cannot, still so long as the excess of cost is within the margin of that profit the work is less expensive to the Council than it would be if done by a contractor. The only complete test of the cost of the two systems would have been if the Works Department had tendered in competition with contractors. That, however, has not been done, and we feel sure, for the reasons stated by Mr. Gruning, that if the experiment were attempted it would prove abortive. In the absence of competition we have to fall back upon comparative statistics of the financial results of the two systems, as shown in what may be considered similar works."

As to engineering works the minority accept Mr. Binnie's view, who, while admitting that he had not the means of judging with exactitude, had formed the general impression that the Works Department had executed the work at a lower rate than contractors had done. According to the best calculations they had been able to make, there had been a saving of more than half the contractors' profit, say more than 6,000*l.* upon work costing 130,000*l.* As to architectural works there had been a "loss" which they could not put at less than 10,000*l.* upon a total of 220,000*l.* Mr. Gruning's conclusion, it is pointed out from the figures as analysed by him, is that the Works

WORKS:—EAGLE WORKS, HORNSEY, N.; PORCHESTER STREET, BIRMINGHAM.

Department has succeeded better in work under the engineer than under the architect, but has not attained the requisite measure of success. Mr. Waterhouse in turn said that if, as he thought, the estimates, especially the architect's estimates, had as a rule been high, any small apparent saving on a comparison of total cost with total estimate might be illusory. On consideration of the statistics and of the reports of the assessors it seems to the minority duly proved that in the case of architectural works executed by the Works Department, so far from any part of the contractor's profit being saved to the Council, there is substantial loss. The minority also consider that the Council should cease to undertake the execution of architectural works. Engineering works stand on a different footing. It is agreed on all hands, by builders and contractors no less than by others, that there are works of that kind that can profitably be undertaken by a municipality, and it is no doubt an advantage that the Council should not be wholly dependent on contractors, especially where it is a question of underground work. The report continues:—

"It remains, however, to be considered what is the best administrative machinery for the Council to use for this purpose. At present the Council employs the works committee. That committee appears to us to be open to the following observations:—

"(1) It is the only one of the committees which is not unanimously recognised as necessary for the administration of the affairs of the Council. It does not possess the confidence of more than a bare majority of the Council. By a very large minority it is looked upon as the experiment of a party policy to which they are opposed—the policy of municipalisation of labour under trade union auspices, and the setting up of the London County Council as a model employer to the exclusion, as far as possible, of contractors, who are to be viewed with distrust. Accordingly every question relating to the works committee is inevitably treated by both sides as a party issue. From the works come dissensions in the Council, dissensions in the works committee, dissensions in the spending committees from which work for the works committee is supplied.

"(2) The works committee personally carry on the business of builders, and for this they do not possess the necessary qualifications. A builder's business is intricate and difficult, and requires skill and everyday attention. The committee are a body of gentlemen with a limited amount of expert knowledge and a limited command of time, and must be looked upon as amateurs. They have the services of a manager. But the

execution of works by the committee through the manager as their subordinate is a totally different thing from the execution by the architect or engineer for a spending committee, as for instance was done in the case of the Crossness schools and the York Road sewer. In this respect also the works committee is different from the other committees, which leave the actual conduct of their business to a qualified and responsible officer. When the works committee personally select the materials to be purchased for works it is much as if the asylums committee were to prescribe for the lunatic patients.

"(3) The Works Department being treated as a contractor, the engineer and architect and their departments on the one hand and the works committee and the staff of their department on the other find themselves in a relation of mutual antagonism with respect to the estimates, with respect to the supervision of the work, and with respect to the settling up of accounts. All parties are thus placed in a false position. The engineer and architect, who would naturally be the expert advisers of the committee, are forced to act as censors of those whose salaried officers they are. In like manner the departments which should co-operate stand from each other at arm's length. So far as the engineer and architect are concerned these difficulties have been minimised by their good sense and fairness. But between the Architect's Department and the Works Department there have been constant dissensions which have been much aggravated by party comments in the open debates of the Council and in the public press. Again, the manager of the works committee does not submit to the rulings of the architect as a contractor is obliged to do, and so great have been the difficulties of settling accounts that the Council has found it necessary to provide for these disputes—disputes on mere matters of opinion and between its own officers—to be referred to arbitration. Lastly, this faulty organisation goes far to explain what otherwise might appear inexplicable, the recent falsifications of the appropriation accounts, which in transferring items of cost from one job to another so as to bring the cost of each nearer to equality with the estimate, had for their object to prevent unpleasant questions being raised between the departments. If the late manager and assistant manager were prompted by a desire to maintain their credit for keeping the cost within the estimate, it was anxiety to avoid friction and departmental jealousy which induced the clerical staff to be parties to malpractices from which they personally had nothing to gain. If existing arrangements are left unaltered the staff of the Works Department will be in future subjected to the same

THE WELL-KNOWN FRIEZE,

ENTITLED

**"THE CORN FIELD."**

1. PLOUGHING; 2. HARROWING; 3. MOWING; 4. CARTING; 5. THE PRODUCTS OF THE CORN FIELD.

Length, Fourteen Feet Seven Inches by Fifteen Inches deep.

**A Splendid Example of Colour-Work in Permanent Ink Photo,  
BY M. PAUL ALBERT BAUDOIN.**

*This magnificent Illustration was presented to the Subscribers to "The Architect" in 1886. A few Proofs were taken, which immediately became out of print.*

OPINIONS OF THE PRESS.

"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition is being issued."—*The Lady's Pictorial*.  
"They are beautifully done in colours by the permanent ink photo process, and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—*The Stage*.  
"The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour-work in permanent ink photo, by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic, and would grace the walls of any house."—*The Gentewoman*.

AND NUMEROUS OTHERS.

In consequence of the almost daily demand for these Plates, they have been reproduced by Subscription at Half a Guinea the Set, and are now ready for Issuing.

**P. A. GILBERT WOOD, 175 Strand, W.C.**

May be had framed in Solid Oak Frames with Mounts, at Three Guineas the set of Five Plates.

strain as that which led to the commission of the recent falsifications. We have been informed that the Council of West Ham, which followed the example of the London County Council in establishing a works committee, have already found themselves obliged to discontinue it for the like reasons, viz. the departmental discords which it inevitably created and allegations as to the unfairness of the estimates of the engineer of the Corporation.

"The objections which we have mentioned are, it is obvious, inherent to the existence of the works committee, and cannot be removed by any reduction in the number of that committee or by any change in its composition. We are, therefore, of opinion that, in the public interest, the continuance of the works committee is indefensible." In conclusion the minority recommend:

"1. That the Works Department be placed under the chief engineer. 2. That no works, whether estimated or 'jobbing,' be undertaken which come within the definition of architectural works. 3. That the works committee be abolished. 4. That the chief engineer be responsible to the spending committee for the execution of all works undertaken by the Council. 5. That for the purpose of financial control a sub-committee of the finance committee be formed to be styled 'The Works Branch of the Finance Committee.' 6. That all materials be purchased by the chief engineer, who shall be responsible to the finance sub-committee for the same and also for the custody of all stores. 7. That the central works so far as they are not required be disposed of. 8. That the system of tendering by selected firms be adopted wherever practicable. 9. That the form of contract be revised so as to remove the main objections raised before the committee on behalf of the contractors. 10. That the above recommendations be not held to restrict the parks committee from undertaking, with the sanction of the Council, such works as have hitherto been carried out by that committee."

The Clerk of the Council reports that communications were received from the town clerks of Birmingham, Glasgow, Liverpool and Manchester, and from some of the principal railway companies giving information about the system adopted by those bodies in carrying out works. Very little work of a structural character is carried out by the corporations referred to without the intervention of a contractor. These bodies appear, however, to undertake by direct labour all works affecting the laying-out, maintenance and repairs of streets. As regards the railway companies, the work carried out without the intervention of a contractor con-

sists of the maintenance of line works, and in some cases of the building and painting of bridges. The reply from Bristol stated that the Corporation undertake constructive works without the intervention of a contractor, and that there can be little doubt that the quality of the work so executed would compare favourably with that of contractors. The reply from West Ham stated that all large works are now put out to tender, the works department having been discontinued as a separate organisation.

## PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

### APPLICATIONS FOR PATENTS.

7493. Herbert Prentice Crane, for "Improvements in floor drains."

7500. Herbert Roberts, for "An improved means of covering water-closet seats when in use."

7505. John Roberts, for "Improvements in window fasteners."

7540. Heinrich Erhard Junghans, for "New or improved wood-stain."

7546. Lionel Dove, for "Improvements in locks and fastenings."

7561. Archibald Ansell, for "Improvements in and relating to casements."

7567. Lyman Ferguson and Robert Hughes Pollock, for "Improvements in extension step ladders."

7575. Frank Starace, for "Improvements in windows."

7592. John Thomas Hales, for "Improvements in letter plates for doors, letter-boxes and the like."

7694. Richard Cunliffe, for "Improvements in window-sash fasteners."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CO., Patent Agents, 73 Chancery Lane, London, W.C.

# THE NEW EXPANDED METAL

**Meshes from  $\frac{1}{8}$ th in. to 6 in. wide. Strands from 24 B.W.G. to  $\frac{3}{16}$ th in. thickness of steel.**

**FOR BUILDING CONSTRUCTION**, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

**FOR SOLID PLASTER PARTITIONS**, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

**FOR FIREPROOF LATHING**, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

**FOR CONCRETE FLOORS WITH EXPANDED METAL**.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

**FOR EXTERIOR WALLS OF BUILDINGS**.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

**FOR FENCING, TREE GUARDS, WINDOW GUARDS**, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

**ORNAMENTAL. STRONG. CHEAP.**

**OTHER USES FOR EXPANDED METAL**.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away.

Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

**BRASS, ALUMINIUM**, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

**CATALOGUES AND PRICE LISTS** can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

**THE EXPANDED METAL COMPANY, LTD.,**

**39 UPPER THAMES STREET, LONDON, E.C.**

## CRYSTAL PALACE SCHOOL OF ART.

FOR more than a generation past the Crystal Palace Company have done excellent work in the art education of the people, but during that period they have been engaged in a work of education which has not been seen by the public at large, but its value will be appreciated by a perusal of the following report of the Crystal Palace Company's School of Art, Science and Literature (thirty-seventh session), School of Practical Engineering, of which Mr. J. W. Wilson, M.Inst.C.E., M.Inst.M.E., F.R.C.I., is principal. The following is the examiners' report for the Easter term, 1897:—

Mr. J. W. Helps, A.M.I.C.E., F.C.S., says:—

It has given me much pleasure to accept the invitation given me to conduct the examination of the students of this school in mechanical engineering, and to examine the work done by them during the past term, and especially so as it has given me an opportunity of observing the excellent lines upon which the educational system is based. The papers worked by the students give evidence of careful attention to the lecturers, and in some instances of considerable ability. Many of the drawings are executed with great neatness, and give promise of good results. I was especially struck with what was shown me in the pattern shop, several of the students having produced work which would not disgrace a trained pattern maker. The work in the fitting shop, though perhaps not quite so high in class, is in many instances well and carefully executed.

Mr. George James Furness, A.M.I.C.E., M.S.E., says:—I have had the honour of examining the students of the civil engineering section of the Crystal Palace Engineering School. The students made uniformly good answers to all the questions asked in the *visû voce* examination, and expressed themselves clearly, showing the thorough grounding they have had in all matters during the course. The drawings and calculations done both in the examination and during the term are excellent generally, and there is no doubt whatsoever that the training gives students decidedly a great advantage in starting out in actual practice in the profession.

## VARIETIES.

THE Norwich and London Accident Insurance Association will remove into new offices at 13 Waterloo Place, Pall Mall (as their West End offices), as soon as the necessary alterations, decorations, &c., are completed. The electric-lighting installation is being done by Mr. T. King, of 40 Week Street, Maid-

stone; the fittings by Mr. B. E. Nightingale, of Albert Works, Albert Embankment, Lambeth; the fascia lettering by Messrs. Clarkson Bros., of Charing Cross Road; and builder's work by Mr. H. S. Stephens, of 228 New North Road, under the superintendence of Mr. Alfred E. Nightingale, architect, 52 Queen Victoria Street, E.C.

THE directors of the Metropolitan Railway Company are contemplating the carrying out of a much needed improvement which involves the entire reconstruction of their King's Cross station. The extremely inconvenient arrangement of this station has long been very prejudicial to the traffic on the line, and though nothing has as yet been definitely decided on, the probability is that as great an improvement will be effected at King's Cross as that which has now been practically completed at Moorgate Street. Great changes in many ways have taken place since this important station was planned, and it has become quite out of date and wholly inadequate to the traffic. It will be troublesome and expensive work to carry out so extensive a reconstruction with many hundreds of trains rushing in and out of the station all day long, but it will hardly be more serious an undertaking than Moorgate Street, and sooner or later it will have to be done. Mr. Sherrin, the company's architect, has prepared plans and constructed a model for the consideration of the directors, and it is expected that in a week or two's time their decision will be arrived at.

### TRADE NOTES.

THE National Schools, Tregarth, North Wales, are being warmed and ventilated by means of Shorland's patent Manchester stoves and patent Manchester grates, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

MESSRS. "CHARLES CARR," of Smethwick, are sending out to members of the clergy a gorgeously illuminated circular drawing attention to the fitness of the present year as an occasion for placing bells in the towers of churches where there are none at present, or for supplementing, recasting or re-hanging existing ones, and they take advantage of the opportunity given by the circular to mention that they have taken into their employ John Buffery (twenty-three years member of St. Martin's Society, Birmingham), the well-known and efficient bell-hanger of the Midland and Northern Counties and North and South Wales.

### BUILDING AND BUILDERS.

A NEW Congregational church is to be erected in Radnor Park, Folkestone, on a site presented by the Earl of Radnor.

THE Duchess of Teck on the 10th inst. laid the foundation-stone of the permanent church of St. Michael's, Southfields, Wandsworth.

MEMORIAL-STONES of the new Liberal club at Ovenden were laid on the 10th inst.

LEXDEN PARK HOUSE is undergoing repairs and redecoration, &c., for Sir A. E. Grant Duff. Messrs. H. & J. Joslin have secured the contract. Messrs. Baker & May, of Colchester, are the architects.

IT has been decided to accept the tender of Mr. George Duncan, 47 Dixon Avenue, Glasgow, for rebuilding and widening Howford Bridge, near Paisley, the amount being 2,574*l.* 17*s.* 3*d.*

MR. ALFRED SHUTTLEWORTH has given a site, valued at over 1,100*l.*, for a new mission church at Lincoln, and 500*l.* towards a mission hall to be used until a permanent church can be built.

AT Mundesley-on-Sea, in the North Walsham and Cromer circuit, the Wesleyan Methodists have decided to erect a new chapel to seat 250 persons, at a cost of 850*l.*, to meet the needs of this rapidly rising east coast watering-place.

ON Saturday afternoon, at the Royal Hospital, Chelsea, the Duke of Cambridge unveiled a tablet to the memory of the late Field-Marshal Sir Patrick Grant, which has been placed in the corridor south of the hospital chapel. The tablet is in a very prominent position in the corridor, and under the bust is a record of the many actions in which General Grant took part.

THE restoration of the exterior of Thirsk parish church has been commenced on the south aisle. The restoration, which is calculated to cost 2,000*l.*, is expected to extend over two years. The interior was restored in 1876 and 1877, and reopened for service in October 1878. Mr. Carnforth, who has for many years been engaged on the exterior of York Minster, is the clerk of the works.

THE memorial-stone of the Hamilton Young Men's Christian Association Institute was laid on Saturday afternoon. The building, which has been designed by Mr. Alexander Cullen, F.S.A., architect, is situated in Gateside Street, and will consist of a structure three storeys high, the first two floors being devoted to the uses of the Association, while the upper flat

**147 STRAND, LONDON, W.C.**

will be let as dwelling-houses. The complete design shows a gymnasium and large hall to the rear.

THE foundation stone of a Liberal club, which is in course of erection at Halifax, was laid on the 10th inst. The plans of the new premises, which are to comprise a billiard-room for three tables, news-room, committee-rooms and an assembly-room, the assembly-room to afford accommodation for 400 persons, were prepared by Mr. M. Hall, architect, of Halifax. The estimated cost is 1,600*l.*, and to this is to be added about 400*l.*, which will be necessary to meet the expenses of furnishing, making a total of 2,000*l.*

THE Nottingham Constitutional Club, the foundation stone of which was laid on the 7th inst. with considerable pomp and circumstance, will be, when completed, of a comprehensive and comfortable character. The principal entrance will be in Market Street, and will lead to a large central hall, from which will be entered a fine smoking-room and billiard-room for three tables. From the hall a stone staircase gives access to a large dining-room, capable of dining about eighty people, with an imposing circular oriel window and balconies commanding a view the full length of Market Street. A private dining-room, committee-room, card-rooms, reading-room, with writing-room adjoining, are also to be provided on the first floor. The second floor will contain bedrooms for members, bath, stewards' rooms, the necessary culinary departments and other offices. A skittle alley is to be provided. Facing Rigley's Yard, and on the ground floor, will be placed a large assembly hall to accommodate from 350 to 400 people, with the necessary retiring-rooms. Although entered from the central hall of the building the assembly-room may be used quite independently of the club by an entrance from Rigley's Yard. The registration offices are also to be approached from Rigley's Yard. It is intended to construct the building of fireproof materials, and to light the premises throughout with electricity. The Market Street front is to be entirely of stone, and the style of architecture adopted is Renaissance. The principal feature will be the large gable and the circular oriel window and balconies of the large dining-room. The architect is Mr. A. R. Calvert, 18 Low Pavement, Nottingham, who obtained the work in competition.

A BRASS memorial tablet to the memory of the late Canon Harper has been fixed on the west wall of the north transept of Selby Abbey.

## MESSRS. WATSON & SONS.

WE recently had an opportunity to pay a very interesting visit to the works of Messrs. Watson & Sons, opticians to H.M. Government, and manufacturers of all that pertains to photography, of 313 High Holborn, W.C., and 9 to 17 Fulwood's Rents, where their premises provide 24,000 square feet of space, and where they have laid down the most modern and approved machinery for wood-working and for the successful carrying out of the various details of their large and comprehensive trade. One of the latest novelties introduced by this enterprising firm, and one of which they have the exclusive rights, is their Motorgraph, which has all the efficacy of the apparatus known as the Cinematograph or Animatograph, and can be produced at infinitely less expense. In fact, it fulfils all the requisite conditions at an exceedingly moderate cost, and will yield effects equal in every way to those produced by the most costly apparatus, and is in many respects, especially in freedom from vibration and simplicity combined with strength of construction, superior to the majority of them.

The motorgraph can be arranged for use as a photographic machine without interfering with its efficiency for projection, and it is then one of the most compact instruments yet designed. It is only necessary that certain light-tight partitions be placed inside the case, a box carrying the film to be exposed fitted to the top of the casing of the apparatus, and a receptacle in which the exposed film may be wound upon a spool after exposure attached to the under portion of the box, so that the amateur can take photographs of any scenes which may interest him, and, having developed them, or, if he prefers it, having got them developed by Messrs. Watson & Sons, can show them to his friends by means of an ordinary magic-lantern. Messrs. Watson & Sons have also devoted considerable attention to the perfection of their apparatus for producing effects with Röntgen's X rays. In this connection we may perhaps mention that, in addition to the manufacture and sale of all the instruments necessary to this interesting branch of science, Messrs. Watson & Sons are acting as radiographers to two large London hospitals, and naturally the extensive experience thus gained, coupled with the suggestions of many of the most successful workers, place them in an unique position in being qualified to advise customers as to their choice of apparatus for various classes of work, and in being able to test in the most thorough manner and to absolutely guarantee all

"I think I am justified in asking you to kindly give me an answer upon the above points before I reply definitely to the request contained in your letter of January 11, 1897."

On January 16 the clerk wrote intimating that the special committee had nothing to add upon the matter, as they understood Mr. Holloway did not desire to avail himself of the opportunity of appearing before them. After an answer from Mr. Holloway pointing out that he was desirous of offering every explanation which the committee might require, providing the terms contained in his former letter were conceded, the clerk wrote on behalf of the special committee:—"I am directed by the special committee to inform you that while the committee do not require your evidence, they are willing to give you the opportunity of attending should you desire to do so, and in such case access to books and other documents will be afforded you."

On January 25 Mr. Holloway wrote:—"I am extremely desirous that all the true facts in connection with the operations of the Works Department should be laid before the committee and should be quite willing to attend for such purpose, but I do not find it possible or advisable to do so without being properly legally represented and without first receiving the assurance asked for by me in my letter to you of the 14th inst. Up to the present moment the various topics dealt with by me in such letter have never been answered or even referred to by you or anyone acting on behalf of the Council."

On January 28 the clerk of the Council wrote:—"I have been directed to inform you that the committee is willing to receive from you any evidence you desire to give, but that inasmuch as you are no longer in the Council's service, the committee is not in a position to require your attendance. Should you desire to avail yourself of the opportunity afforded to you to attend, the committee will place no obstacle in the way of your being legally represented, although it does not appear to the committee that such legal representation is necessary."

"The only other observation the committee has to make with regard to the assurances for which you ask is as to your being indemnified against all reasonable costs and expenses which you might have to bear by reason of your attendance. The committee do not agree as to the necessity for such an assurance, but they have requested me to remind you that power has been given to the committee to make an allowance to witnesses to meet expenses incurred by them in attending to give evidence."

To this Mr. Holloway answered:—

"I am in receipt of your letter of January 28, 1897, for which I thank you, and shall be glad to call upon you with reference to the allowance which the Council will be prepared to make to me to cover loss of time and reasonable legal expenses. Before, however, doing so I should be glad if you would inform me whether my legal representative would be permitted by the Council to cross-examine on my behalf such witnesses as I may think necessary to submit to cross-examination. In stipulating that I should be legally represented my principal object was that the witnesses who have already given evidence before the sub-committee and the present committee, and those who are to give evidence before the present committee affecting me, should be thoroughly cross-examined on my behalf with a view to eliciting the truth."

On February 4 the clerk wrote declining, on behalf of the committee, to accede to Mr. Holloway's request with reference to the cross-examination of witnesses, and the correspondence closed with a letter from Mr. Holloway dated February 8, in which he says:—

"I am in receipt of your letter of the 4th inst., in which you inform me that the special committee refuses to allow witnesses to be cross-examined on my behalf before the committee. My principal object in offering to attend before the committee and stipulating that I should be legally represented was that the true facts might be elicited as to the past operations of the Works Department and my conduct as its manager. Seeing, however, that my legal representative is to be prohibited from rendering any professional assistance in such direction, his attendance before the special committee would be futile, and would simply be reduced to an expensive and useless formality. Under these circumstances I have no alternative left to me but to respectfully decline to attend before the special committee under the conditions laid down by your letter of February 4."

### A NEW ELECTRIC ACCUMULATOR.

WITHIN the last few years there have been many new accumulator cells introduced, more particularly for the running of tram-cars, and, later, motor-cars. The older forms of accumulator, although good for stationary work, will not withstand the very severe conditions of tramway working, and the still worse conditions in motor-cars. The object of inventors has been,

ESTIMATES and DESIGNS for JUBILEE DECORATIONS submitted free of charge.

and is, to reduce the weight, increase the discharge rate and the capacity per pound weight of cell, and to construct an accumulator which will stand the heavy strains while starting the cars, also the vibration and washing action. The accumulator under discussion is the invention of Herr Paul Ribbe, and it is designed chiefly for tramway working.

An invitation was received by several engineers and representatives of the press to witness the trial of a tramcar fitted with these accumulators, at the dépôt of the London, Deptford and Greenwich Tramway Company, at Lower Road, Deptford, on Tuesday, April 6.

The car, which has been brought from Germany, is a very finely appointed one, arranged for inside passengers only. It is fitted with the electric light, and is most comfortable in every way. The car could not be run on the roads, it was explained, because the County Council had not yet sanctioned it, but it was hoped that it would be running very soon.

However, about 20 yards of straight track in the tramway shed was utilised and the car ran along this. It is to be regretted that a more extensive trial was not possible, as very little idea could be obtained of its behaviour under working conditions with curves and gradients. It was also explained that the car is constructed for a track with slight curves only, and as the curves on the London, Deptford, and Greenwich Tramway are very severe, this is, no doubt, the real reason why the car was not run on the road.

The electrodes are constructed in the following manner:—The grid or conducting support is of lead, which appears to be about  $\frac{3}{4}$  to 1 lb. weight to the square foot. This grid is perforated by vertical slits which are about  $1\frac{1}{2}$  inches long, and there are cross pieces of solid lead at distances of roughly about  $1\frac{3}{4}$  inches. The grid is covered on both sides with flat vertical ribs of celluloid of about  $\frac{1}{15}$  inch in breadth, which have trapezoidal or conical cross sections, so as to divide the surface of the plate into long thin rectangles. The whole is then pasted on both sides, the paste being level with the vertical ribs of celluloid. The object of these ribs, together with the perforations in the grid, is to keep the paste in contact with the conducting grid. To provide, however, against the possibility of the ribs not being sufficient, a thin perforated sheet is cemented to the free surfaces, for the purpose of keeping the paste in contact with the grid should it become loose. It is, however, well recognised amongst accumulator experts that when the active material of the plates becomes loose, or even partially detached, there is a bad contact between it and the grid, and it is worse than useless.

Every time the battery is charged these partially detached pieces are not charged fully, and consequently if the cell is allowed to stand, a local current is set up between the fully-charged and the imperfectly-charged material; thus the plate is in the course of a day or two discharged to some extent by local action, and the efficiency and capacity is reduced. The high resistance between the grid and the detached piece will not prevent a small local current flowing for several hours. The inventor of this plate appears, however, to think that the vertical ribs will keep the paste on the grid, and that if they do not the perforated celluloid will do so.

A piece of celluloid is not stiff enough to resist molecular forces, and it cannot exert sufficient pressure to make a good contact between the detached paste and the grid.

As far as the shedding of the material in the form of powder is concerned, the perforated celluloid will not prevent this, although it will keep large pieces of detached material from short-circuiting the plates. This is done in other plates by placing sheets of perforated celluloid on the faces of one of the plates, say the positive.

A weak point in this cell is the very thin lead sheet used as the grid or support for the positive plate. It is claimed that as the grid is completely covered by paste and the celluloid ribs, that there can be no local action on the grid, and that it will not be eaten away. Past experience has shown that by reducing the thickness of grid the capacity per pound is undoubtedly raised, but in that case the life of a battery cannot be long. It is also to be noticed that no mention of the life of the plate is made in the descriptive circular that was distributed, but a statement to the effect that the action upon the grid is less in this than in other plates.

There is a large amount of celluloid in these accumulators, even the containing-box being of that material; but there is no objection to its use if specially prepared, although the present cost is high.

The battery in the car consists of 140 cells, each having seven negative and six positive plates 8 inches broad and 12 inches high, and it is stated to have a capacity of 81 kilowatt hours (at what rate of discharge was not mentioned). The battery is supposed to run the car 20 hours, i.e. 4 horse-power average on the motor for 20 hours. The motor was said to be of 40 horse-power, but this seems high. The weight of the battery was given as 2 tons 15 cwt., and it is charged in position underneath the seats of the car. It was to be regretted that almost everyone connected with the battery had a very

limited command of the English language, and information was only attainable under difficulties, but these gentlemen spared no pains to give information, and were remarkably courteous under very trying circumstances.

Mr. Carruthers Wain (chairman of the Tramways Institute) proposed the success of the battery and the inventors.

The tramway shed was tastefully decorated, and the visitors were very well received and provided for.

### PRACTICAL PLUMBERS' WORK.

MR. J. WRIGHT CLARKE prefaced his lecture on this subject at the Carpenters' Hall on the 24th ult. by stating that the impossibility of doing several examples of plumbers' work within a reasonable time prevented a practical demonstration of work being actually done in the hall. Most lectures on plumbing were confined to sanitary matters. This lecture would deal chiefly with other details of plumbing work in connection with buildings, beginning with the ridge of the roof, which in olden times was simply covered by a piece of lead fastened on as a saddle-piece. The wind got under this, and now a roll of wood is used, undercut in such a way that the lead can be clasped on to it. If the wooden roll is fixed too low down the lead has no proper grip, and in dressing the lead the slates are unduly pressed in at the top, and more liable to be broken. In fixing the ridge, it should look straight. Where the lead laps occur the wood of the roll must be cut away and the lead recessed, or the lap will form a bump. Flashing is the term applied to the lead let into walls where roofs or gutters join them. It is not enough merely to rake out the joint where the lead is to go, but every joint should then have a little cement put in sloping outward. The flashing is then fixed in the joint by means of wedges, which should always be of lead. Wooden wedges should never be used. Rain swells the wood and loosens the work, and when dry the wedges fall out. In using flashing with a tiled or slated roof the commonest way is to have the lead over the slates or tiles, but this permits the wind to turn up the lead or blow water under. As the slates have a fillet of wood or tilting piece to throw the water off, there is also a greater probability of a plumber breaking the slates when dressing the lead. When the flashing is fixed under the slates what is termed a "secret gutter" is generally formed. The lead is dressed down into a hollow in the wood,

and inside the secret gutter so formed the lead has a fold or "welt" on the edge under the slates. This method is not nearly so good as that of fixing with each row of slates a piece of lead termed a soaker, which is turned up the side of the wall. It is usual to put over these soakers a strip of lead or "cover flashing." The best method, and one which many architects prefer, is to have the soakers large enough to permit of each soaker being step-flashed into the wall. A similar provision can be used for hip roofs. For tiled roofs purpose made tile hips can be used, but with slates lead or some other metal is necessary. When a roll is used for hips the lead should be in short lengths, in order to avoid having too great a weight depending from one fixing point. If it is desired to hide the lead on the hips this can be done by using soakers worked over the hips with each row of slates.

Owing to the expansion and contraction of lead by changes of temperature it cannot be fixed in indefinite lengths. The expansion produced by even one degree of heat is considerable, and if laid in great lengths lead would become warped, distorted and torn away from its original position. No lead gutters or flats should have more than 7 or 8 feet in one length. Where these lengths join it is customary to have a so-called "drip," or change from a higher to a lower level. This drip is generally far too shallow. In a great number of cases if you turn up the upper lead, or "over-cloak," the wood underneath will be found rotten. This is caused by the water drawn in by capillary attraction. Water near to any two surfaces which nearly touch is drawn up a certain distance, as in the case of the laps in the glass of a skylight, and if the lap is too narrow leaks into the house. To prevent this in the case of roofs and gutters there should be a standing rule to have no drips less than 2 inches deep. It would be still better to make them 2½ inches. The seam roll used in old roofs and the various methods of dealing with "torus" and other wooden rolls in modern roofing were illustrated by the aid of diagrams. "Cesspool" is a curious term in connection with a roof; but, technically, it is the term applied to where the rain-water is collected. To prevent the outgo of this cesspool being choked with leaves, it is usual to have a small circular grating which fits into the outgo. Such a grating means money ill-spent. Either it gets swept away or it does more harm than good by becoming easily choked and causing the house to be flooded. A proper grating should be the full size of the cesspool, and strong enough for a sweep to walk upon. In dormer windows the lead is sometimes fixed to the cill. This is wrong. The lead

445 OXFORD STREET, LONDON, W.

should be under the cill, fixed before the window-frame, and turned up inside. This is also the proper method with a lantern light, but in this case the lead turned up inside is made to form a condensation-gutter. Channels are provided to carry off the moisture, but these channels must not be large enough to admit snow in winter or blacks in summer. The sides of dormers are sometimes fixed by "solder dots," that is, a dot of solder covering the head of a screw or nail. This is a poor, wretched way of doing, and sooner or later the pull and thrust of the lead will break the dots. It can be fixed firmly enough without dots. With trap-doors or skylights care should be taken to have the upper side forming an acute angle with the roof. If the angle is too easy the rain rushing down runs up under the skylight or trap-door and into the house.

Referring to the various qualities of lead as indicated by the number of pounds each square foot weighs, the lecturer said the quality insisted on by sanitary authorities must only be regarded as the minimum quality. Good engineers and architects use heavier qualities. Ten pounds lead is used for 3-inch, 3½-inch or 4-inch soil-pipes; that is, nearly half as thick again as the 7 lbs. required by London County Council regulations. A copper bit-joint is never made by a plumber; a wiped joint is the right one. Square junctions are bad; all junctions should have an easy bend in the direction of the flow. Soil-pipes must have adequate fixing to carry the weight. In some cases three-quarters of an hundredweight of lead is found hanging on two nails. If the soil-pipe slips down it drags the trap out of shape, it no longer acts as a seal and poisonous gas may escape into the house. In joining lead soil-pipes to stoneware or iron drain-pipes a brass ferrule or thimble is soldered on to the lead. This is fixed to the stoneware by a cement joint, or to the iron by a caulked lead joint.

The bottoms of sinks should have a fall towards the outlet, which should be as near to the waste-pipe as possible, and the trap should be close to the sink. The sink should be fixed on cantilevers in order to keep the space under as clear and clean as possible. Cases, however, occur when a client who resolves to be decidedly sanitary in his first arrangements subsequently calls in a man round the corner to make an enclosure under the sink, which becomes a receptacle for very unsanitary oddments. To meet the wishes of those who dislike the appearance of round soil-pipes on their façades square pipes have been introduced having internal rounded angles. Round pipes are, however, the best, because they are more thoroughly cleansed by the scouring action of the flow.

Alderman Sir Stuart Knill, in moving the usual vote of thanks, said he had probably been asked to preside on this occasion because of his connection with the Plumbers' Company and with the work of that Company in endeavouring to restore the reputation of the plumber's craft to what it was in olden times, when every craftsman was an artist and took a delight in his work. The craft of the plumber holds a creditable place in history, and once included working in tin under the term "Plumbing album." Phœnicians and Romans came to this country for both lead and tin. Pigs of lead are found bearing the names of Roman emperors, and in hypocausts and other ancient works we have leadwork beautifully ornamented. Lead has been treated so artistically as to earn the name of golden work. Like most badges, that of the Plumbers' Company is gold, but the fine Tudor rose worked upon it is lead. It will be remembered, too, that Shakespeare, in the "Merchant of Venice," exalts the caskets of lead above the caskets of gold and silver. In these lectures the Carpenters' Company were endeavouring to make every artisan take a real interest in his trade, and to show him that true craftsmanship was a valuable acquisition, of which the owner might be justifiably proud.

### RAILWAY CONSTRUCTION IN NEW ZEALAND.

THE following standard specification is used for co-operative contracts on Government railways, New Zealand.

#### *Materials and Workmanship.*

1. Except where otherwise specified all the workmanship and all materials used under this contract, when supplied by the co-operative contractors, shall be of the following kinds and descriptions:—

Sand for mortar and concrete shall be clean, sharp, washed sand, free from soil, clay or vegetable matter. Shingle for concrete shall be fine, clean-washed shingle free from soil or clay; no piece shall be larger than 2½ inches in any dimensions, and it shall not contain more than 5 per cent. of its bulk of sand. Broken stone for concrete shall be of hard tough stone, clean and broken to 2½-inch gauge.

Metal shall be hard tough broken stone, of approved quality; no piece to be larger than will pass through a 2½-inch ring.

Concrete shall be composed of one part of cement to six parts of shingle or broken stone and two parts of sand, gauged by measure in a box of approved shape, and turned twice

# EWART'S COPPER "CROWN" VENTILATOR

FACTORY—346, 348, 350 EUSTON RD.,  
LONDON, N.W.

together while dry and once wet before being deposited. The concrete shall be used immediately upon being mixed, and kept wet until set. Concrete shall be deposited in layers not exceeding 12 inches in thickness, and well rammed. No layer shall be deposited before the preceding one has properly set. When laid in water such precautions as the resident engineer may approve shall be taken to prevent the cement washing out.

All concrete face-work shall be finished off with a  $\frac{1}{4}$ -inch coat of cement mortar, laid smoothly and evenly.

Mortar shall be of three parts of sand to one of cement, gauged by measure.

The components of mortar and concrete shall be gauged and mixed in the presence of the overseer.

Brickwork shall be laid to English bond, joints not to exceed  $\frac{1}{4}$  inch in thickness; it shall be set in cement mortar and neatly pointed. Bricks shall be properly bedded in mortar, and not laid dry under the plea of being afterwards grouted; they shall be kept properly wetted during laying.

Rubble masonry shall be set in mortar; it shall be well bonded and levelled every 12 inches or 18 inches in height. Walls 2 feet 6 inches thick and under shall have one through header for every superficial yard of face, header not to exceed 12 inches in height; walls over 2 feet 6 inches thick to have one 2 feet 6 inch header, not more than 12 inches high, to each superficial yard of face and back.

Ashlar masonry shall be axe-dressed, or sawn on beds and joints and rock-faced in front. The beds and joints shall be truly square to each other and to the face. The work shall be laid in courses and truly level. The courses shall be at least 12 inches thick. Walls 2 feet 6 inches thick and under to have one through header to each superficial yard of face; walls over 2 feet 6 inches thick to have one header at least 2 feet 6 inches long to each superficial yard of face and back. No stone to be greater in height than in breadth. All face-stones to have  $\frac{1}{2}$ -inch chisel-draft around the angles.

Culverts, drains and other structure of every kind shall be founded on firm and sound strata, and excavations shall be made to such depths and of such dimensions as the resident engineer may consider necessary to obtain the proper stability and sufficient bearing-area. Excavated materials shall be filled in and well rammed around the foundations when laid; the surplus shall be removed as directed.

Arch-face stones for rubble masonry shall be axe-dressed or sawn on the beds and joints, with rustic face and chisel-drafts

around all the angles. The arch-face stones to be the full depth of the arch, and properly bonded with the inner work. All beds and joints shall be truly square or radial, as may be required. Coping shall consist of flat stones on edge set in cement mortar, and shall be finished off in a workmanlike manner to such form as the resident engineer may direct.

All stone used in masonry shall be laid on its natural bed; it shall be of a kind and quality approved by the resident engineer.

The joints in rubble masonry shall be raked out and neatly pointed.

The 12-inch and other drain-pipes will be supplied by the Government and delivered to the contractors along the road at points as nearly as possible opposite to where they are required to be inserted. The contractors will require to convey them from the points of delivery to where required along the works.

All work shall be carried out and be finished off in every way as directed by the resident engineer.

#### *Felling, Clearing and Grubbing.*

2. The whole of the timber within at least a chain and a half of the centre-line on each side shall be felled, and in no case for a less distance than half a chain beyond the foot of the slopes of the embankment or the top of the slopes of the cuttings.

All logs, underbrush, scrub and other vegetation shall be removed and cleared away for a distance of at least half a chain on each side of centre-line, and in no case for a less distance than 10 feet beyond the foot of slopes of embankments or the top of slopes of cuttings; and no such matter shall be left under any part of the embankments, or mixed with the materials which form the embankment.

In cuttings and along formation on the surface all stumps and roots shall be grubbed out and removed; in embankments no stump shall be left within 3 feet of formation-level, or within 2 feet of the surface in slopes.

All scrub shall be burned when and as directed by the resident engineer.

#### *Earthworks.*

3. Except where otherwise directed by the resident engineer, all vegetation growing on the line of railway shall be cleared off to the full width of bottom of bank.

*Cuttings.*—The cuttings are to have a base at formation-level of 12 feet in solid rock and 13 feet elsewhere, and are to be made in accordance with plan and section. The slopes

Price Two Shillings.

OFFICE: 175 STRAND, LONDON, W.C.

shall be  $\frac{1}{2}$  to 1 in solid rock, and 1 to 1 in all other material. It is, however, specially provided that the resident engineer shall be sole judge as to what class the material in the cuttings belongs, and any alteration of the widths or slopes of cuttings will be ordered in writing.

The material obtained from the cuttings and side drains shall be used in making the embankments, and should it be insufficient for the purpose the contractors shall obtain the balance by widening cuttings or from side cuttings, as may be directed by the resident engineer, but no side cutting shall under any circumstances be made within the area of station ground. All slopes shall be neatly and uniformly trimmed off from top to bottom to the inclination shown or specified.

During the execution of the works the formation and slopes shall be properly drained, so as to prevent any lodgment of water.

A drain is to be cut along the bottom of slopes of cuttings, as shown in drawings, and in all cases must be provided with a proper outfall of at least the same size. Catchwater drains shall be dug above the top of one slope of all cuttings and where necessary above banks, at a distance not exceeding a chain from the top and foot of slopes. These ditches shall average 5 cubic feet per lineal yard, and shall be true and regular to the inclinations directed. No stumps or roots to be left in them. They shall be made at the commencement of the work with proper outfalls, and shall be cleared out from time to time as may be necessary or ordered.

**Embankments.**—The embankments must be carried forward uniformly of the proper shape, with such an addition to the heights and widths, to allow for subsidence and shrinkage, as the resident engineer may consider necessary, so as to avoid as far as practicable the necessity for making subsequent additions either to the heights or widths of the embankments to bring them to the correct levels and dimensions. When not otherwise directed, the allowance for shrinkage alone is to be not less than 1 inch to every foot in height.

Whenever the foundation of an embankment is on sloping ground, steps and benches must be cut under the base of the embankment; and should the seat of the embankment be of soft material, the contractors shall remove the same.

No vegetable substance or other material objected to by the resident engineer shall be put into any embankment.

The top of the ordinary single-line embankment shall have a width at formation-level of not less than 6 feet on each side of centre, with slopes trimmed off to an inclination of not less

than  $1\frac{1}{2}$  horizontal to 1 vertical, and to be maintained full and true until the completion of the contract.

Whenever any change is made in the inclination of any or the slopes it must be done gradually, and in not less than 20 yards in length.

The contractors shall not in any way interfere with or divert the existing drainage areas, unless otherwise directed, and shall leave such stops or stanks in the side cuttings, and take such other precautions as the resident engineer may think necessary for that purpose. The side cuttings for bank material must be made in a regular and approved manner, and, unless specially authorised, not less than 10 feet from the foot of any embankment, nor less than 5 feet from any fence, and where they have to act as drains shall be taken out clear and to a uniform inclination. No material shall be run to spoil except with the written sanction of the resident engineer. When material is run to spoil it must be done in such a way and in such places as shall be approved by the resident engineer.

Behind and around abutments, culverts, walls, piles, struts and all structures of masonry or timber of what kind soever, the embankments shall be wheeled in and carefully rammed. Any injury done to such culverts or other structures by movement of the embankment shall be repaired and made good by the contractors.

The station yards shall be formed throughout to the formation-levels indicated for the railway adjoining.

#### *Stream Diversions and Ditches.*

4. Stream diversions shall be cut where and as directed. The bottom of the cut shall have a uniform inclination throughout, and shall be made at a level commencing at the bottom of the stream at the lower end, and terminating at the bottom of the stream at the upper end of the diversion. The base of the cutting shall be equal to the base of the stream diverted, and the slopes shall be as specified for cuttings.

#### *Culverts and Drains.*

5. Walls of culverts shall be of rubble or ashlar masonry in cement or concrete. The arches and inverts shall be of brickwork turned-in rings, or rubble masonry in cement, or concrete, as ordered by the resident engineer; and the walls, arches and inverts for each class of work are to be of such thickness as he shall direct. Arches shall be built on centres and in approved frames, and in accordance with instructions.

The frames of timber culverts shall be mortised and tenoned

and pinned; the planking shall be securely spiked to the frames. The edges of the planking must fit truly for the whole thickness, and the planks must extend over at least two panels and break joint as much as possible.

Dry stone culverts shall be constructed as shown upon the drawings.

All culverts shall be covered with a 9-inch layer of well-wrought clay puddle.

The foundations for culverts shall in all cases be carried down to solid ground and prepared for upper work to the satisfaction of the resident engineer.

Sufficient inlet and outfall drains shall be dug at each culvert, and all rocks and stumps in them shall be removed.

Such drains shall extend at least  $\frac{1}{2}$  chain from each end of the culverts.

All stoneware pipes or box-drains shall be laid in trenches in all cases to be cut in the solid, and the pipes or box-drains shall be bedded and encased in well-wrought clay puddle. The joints of the pipes are to be set with cement mortar, and their ends protected with concrete, rubble or brickwork, as shown.

### BLACKWALL TUNNEL.

At the ordinary meeting of the Institution of Civil Engineers on Tuesday, April 6, Mr. John Wolfe Barry, C.B., F.R.S., the president, in the chair, the paper read was on "The Blackwall Tunnel," by Mr. David Hay, M.Inst.C.E., and Mr. Maurice Fitzmaurice, B.A., B.E., M.Inst.C.E.

Communication between the north and south banks of the Thames below London Bridge was very poor, and many attempts had been made during the last hundred years to give greater facilities for crossing. Tunnels had been begun between Tilbury and Gravesend in 1798 and between Limehouse and Rotherhithe in 1805, while Brunel's great tunnel between Wapping and Rotherhithe was begun in 1825 and finished in 1842. Various other schemes for tunnels had been brought forward, but that at Blackwall was the only one which had been commenced. The contract for the work was let in 1891 for 871,000*l.*, and operations were started early in 1892. The entrance to the tunnel on the north side of the river was in the East India Dock Road, close to the East India Dock gates, while at the south side the entrance was in East Greenwich. The total length of the tunnel was 6,200 feet, of which about one-half was "cast-iron lined," the remainder being "cut-and-

cover" and "open approach." A considerable amount of work was necessary for the diversion and reconstruction of main and branch sewers which were interfered with by the tunnel. The open approach at each extremity of the tunnel was constructed with concrete and brick retaining-walls, with a facing of white glazed bricks and a concrete invert. A layer of asphalt was carried round it to insure watertightness. The cut-and-cover work consisted of four or five rings of brickwork in cement, and was circular in section; it was backed with a minimum of 2 feet of concrete, and a layer of asphalt was interposed between the brickwork and concrete. There were four shafts on the line of the tunnel, and these were placed at the horizontal or vertical changes of direction. They were constructed of steel and iron double-skinned caissons, of 58 feet external and 48 feet internal diameter. They had also an internal lining of white glazed brickwork. Two openings for the tunnel were provided in each caisson, which were closed when sinking by easily removable iron plugs. Air-tight floors were placed above the tunnel openings, so that compressed air could be used either while sinking or while the tunnel was being driven through. Two of the shafts had been sunk by keeping the water pumped down and excavating inside in the ordinary way, one by excavating the material (gravel) by a grab worked from a crane on the top, and the fourth partly by grab and partly by manual excavation. In both the latter cases, however, the concrete and iron floors at the bottom of the shafts had to be inserted under compressed air.

The "iron-lined" portion of the tunnel was constructed by means of a shield, and compressed air had been used for nearly the whole length, the pressure varying between a few pounds and about 27 lbs. above the atmospheric pressure. The external diameter of the cast-iron lining was 27 feet and the internal diameter 25 feet and 25 feet 4 inches, each ring of lining forming a length of 2 feet 6 inches of tunnel. There were fourteen segments and one key-piece in each ring; all the sides of the segments were planed and all the joints caulked. The internal lining consisted of 4 to 1 concrete with glazed-tile facing. The tunnel was driven through materials of a very mixed nature, varying between hard water-tight clay and coarse ballast in direct communication with the river. Near the centre of the river the tunnel passed within 5 feet of the river-bed, but for some distance on each side of this point a layer of clay 10 feet thick had been shot from hopper barges to facilitate operations. On two occasions the tunnel was flooded by sudden "blow-outs" and the consequent inrush of water.

## MCNEILL'S FELTS

CANDELABRA, &c.

REPRODUCTIONS OF

**The FINEST EXAMPLES.**

The shield used was 27 feet 8 inches in external diameter and 19 feet 6 inches long. It was shoved forward by hydraulic jacks which exerted at times a total pressure of over 5,000 tons. It carried two hydraulic erectors for placing the cast-iron segments. Every precaution was taken in the construction of the shield to minimise the result of accident from a sudden inrush of water, and provision was made for working with either a closed or open face. A very large air-compressing plant was required to maintain the supply of air, and at times as much as 10,000 cubic feet per minute was pumped into the tunnel.

The roadway, which was 16 feet wide, was carried on a brick arch which formed the roof of a subway for pipes, electric-light wires, &c., and a footpath 3 feet wide was provided on either side.

An electric-light installation had been erected for the permanent illumination of the tunnel and the supply of current for working the drainage-pumps, &c.

### GOVERNMENT BUILDING IN NEW SOUTH WALES.

THE following is the latest report of the Government architect, Mr. Vernon, to the Legislative Assembly of New South Wales :—

I have the honour to present my report upon the work carried out in this branch for the eighteen months ending June 30, 1895, in the erection and completion of new public buildings, and in repairing and furnishing and improving existing ones, and also in carrying out other miscellaneous services.

The expenditure is detailed in the schedule attached, and, as compared with that of the previous years 1893-94, is as follows :—

	1894-95 (18 months).			1893-94.		
	£	s.	d.	£	s.	d.
Buildings and services . . .	192,109	7	7	215,395	19	8
Furniture . . . . .	14,878	8	9	6,751	16	9
Officers' expenses, including travelling and contingencies	23,607	16	3	17,175	11	3

This expenditure has been incurred in connection with 630 buildings, of which nine are buildings completed or entirely erected within the period.

Uniform care has been exercised in dealing with these several expenditures, and notwithstanding that during the

period considerable alterations have been effected in the office management, and the "General Conditions of Contract" entirely revised, no litigation has taken place, but, on the contrary, proper settlements have in all cases been arrived at.

The amount expended, it will be seen, is considerably smaller than that of previous years, and this is accounted for by the fact that the Government has, during the period under review, pursued a policy of the strictest retrenchment and economy, so that the erection of no new building was undertaken except where absolutely necessary for the proper performance of the public service, a large number of schemes already more or less dealt with in the office being postponed until the circumstances of the Colony altered for the better.

In addition to these, it may be noted that owing to the generally depressed condition of the building trade work was done at greatly reduced cost, amounting to as much, probably, as 25 per cent., and therefore the expenditure covers a comparatively greater amount of work than that done in previous years.

I attached to the annual report of 1892 a complete schedule to date of the buildings in charge of this branch, setting forth the estimated value of the sites and the actual cost of erection, or, where this is not possible, the estimated value of the buildings. Correcting this schedule to date of the period of the present report, the results are as follows :—

List as per return 1893-94 . . . . .	£8,248,211
" " 1894-95 . . . . .	162,411
Total . . . . .	£9,410,622
Total number of buildings and establishments . . . . .	947

The above is, of course, exclusive of the considerable sums that are annually expended on minor additions and improvements and general repairs, which are all disbursed from revenue. Since this schedule was originally prepared, it is well known that real property in the Colony has suffered a most serious depreciation, and, therefore, the above figures must not be taken as any guide to present values.

I am able to report that the country buildings are being gradually brought up into a better state of repair, but I would again invite attention to the inadequacy of the service votes which are appropriated for this purpose. In the report of 1893 I ventured to show the great diminution in the amount voted, the same decreasing from 82,000*l.* in 1889 to 27,400*l.* in 1893, the amount voted for the period covered by this report being

46,000%, or 30,666% per annum. Allowing 8,250,000% as the capital cost of the buildings new, it may be taken that depreciation takes place at the rate of at least 1.25 per annum, giving the average life of a building at about ninety years. The sum at my disposal, namely 30,666%, represents .37 per cent. only, and when it is taken into consideration that this percentage has to cover not only annual repairs, but numerous minor improvements and additions, it will be seen that the service is to a degree below the point of efficiency.

To put this matter in another way—the average sum available to be expended under these heads on each building amounts to 32l. 7s. 8d., and it must be recollected that not only is a small country post office included, but such large establishments as Callan Park Hospital for the Insane, Parliament House, Government House, &c. It is therefore apparent that many buildings must necessarily remain year after year without proper attention. I have before stated that a large portion of this sum has been appropriated from perpetual loans to meet the capital cost of these buildings, and it is a matter for serious consideration, therefore, whether a larger percentage on this amount should not be expended upon the buildings, otherwise the value of the security must be yearly diminishing.

The important buildings of the Sydney Hospital have been erected at a cost of 80,810l. 16s. 9d., so far as the second and completing portion is concerned, under the supervision of Mr. J. Kirkpatrick. A commencement was made with the scheme for the erection of the Kenmore Hospital for the Insane, and the sum of 17,245l. expended in the partial erection of the Administrative Buildings which it is intended shall temporarily accommodate patients, pending the erection of the patients' wards. In July, 1894, a fire occurred in the roof of the Public Works Offices, doing damage to the extent of about 1,100l., and in considering the rebuilding that became necessary, the Minister thought it advisable to add an extensive mansard roof and central dome, thus giving a large amount of additional accommodation and adding considerably to the architectural completeness of the building. After deliberation he deemed it desirable to depart, in this case, from the usual method of inviting tenders in public competition, and instructed that the work should be carried out by the direct employment of workmen and the purchase of the necessary plant and material.

Towards the end of 1894 the Government saw its way to institute a season of greater activity, and the erection of many buildings in the country, which had previously been deferred

for reasons already given, it was now found desirable to proceed with; accordingly Parliament voted in December the sum of 136,635l. towards that object, and I then received instructions from the Minister to proceed with the preparation of the plans and the inviting of tenders for upwards of eighty-three buildings distributed in different parts of the country.

The staff was then much reduced, and it became necessary to engage a number of temporary draughtsmen. With the Minister's permission I instituted a competitive examination, with the result that out of seventy-two applicants for employment fifty underwent the test examination. This enabled me on merit alone to recommend the engagement of the six draughtsmen required and the result has proved satisfactory.

During the period covered by this report it was found that the number of private buildings rented by the various Government departments was entailing a very large and increasing annual rental, and steps were taken to see what could possibly be done in re-arrangement of the Government departments, so that as the various outside leases fell in these could be more fully occupied and the rented premises given up. As opportunities occurred, therefore, arrangements were made which I am confident will show eventually that very large savings have been effected, in addition to greater efficiency and centralisation of the Government offices generally.

In January last a Royal Commission to inquire into the Civil Service was sitting, and I was called upon to give evidence before it, both as regards the duties and salaries of the various officers, the general organisation of the office, and the procedure relative to the erection of new public buildings. My evidence will be found in the report of the Commission issued April 8, 1895. The professional staff at the end of the period reported on (with the exception of the employment of the temporary draughtsmen already referred to) consists of the same personnel as during the previous year and at the same salaries.

The clerical staff underwent considerable alteration consequent on the reorganisation of the clerical and accountancy branches of the Public Works Department generally. This change involved the retirement of two officers of long standing and of proved zeal and ability, Mr. G. B. Stack, accountant, on twelve months' leave of absence, at the expiration of which period he will have completed thirty-three years and three months in the service, and Mr. L. J. Marks, record clerk, on nine months' leave of absence, at the expiration of which period he will have completed twenty-five years and three months'

PRICE LIST AND ESTIMATES ON APPLICATION.

service, also the transfer of all other officers (including Mr. S. Steel, chief clerk) to the Public Works establishment, with the exception of Mr. Forsythe, secretary, Mr. Cooper, shorthand writer and correspondence clerk and two specification clerks, without whom it would have been impossible to have conducted the clerical work pertaining to the professional side of the office.

The staff at the close of June 1895 was as follows:—Government architect, principal assistant architect, two assistant architects, three assistant architects (acting), building surveyor, sanitary engineer, six district inspectors, five draughtsmen, nine draughtsmen (temporarily engaged), eleven clerks of works, plan-mounter, &c., secretary, shorthand and correspondence clerks, two specification clerks (chief clerks and seven clerks transferred during period).

The total office expenses, including contingencies, travelling expenses, &c., amount to 23,607*l.* 16*s.* 3*d.*, of which the sum of 4,430 *7s.* 1*d.* was provided for in the clerical division of the Public Works Department. No staff appointments were made during the period.

In former reports I have endeavoured, as correctly as possible, to give approximate statements as to the percentage costs on the expenditure under the following heads:—Professional; superintendence of works; clerical; contingencies, travelling expenses, &c.; but inasmuch as a large amount of office work, particularly in the professional branch, has been constantly performed, which has no reference to expenditure whatever, it has always been somewhat difficult to ascertain the percentage with an absolute degree of accuracy.

A return was asked for in the House for the expenditure and cost of carrying out works during the twelve months ending August 31, 1894—a period in which, it must be observed, the strictest economy was being exercised, and the money expended was devoted almost entirely to general repairs and small additions on buildings scattered throughout the Colony, in which the maximum of services were required for the minimum of result. Under these somewhat disadvantageous circumstances the return came out as follows:—

Professional.	.	.	.	.	2'50 per cent.
Superintendence	.	.	.	.	2'50 "
Clerical	.	.	.	.	1'50 "
Contingencies	.	.	.	.	1'00 "

The above rate is the average taken over works of every character, including a small repairing contract for £25 in a

country township, perhaps 500 miles from Sydney, as well as on the larger works near the city, amounting, as in the case of additions to the Hospital for the Insane, Rydalmere, to £15,000.

In conclusion, I have again great pleasure in bearing testimony to the zeal, skill and industry displayed throughout the whole of the period by the staff under my direction.

### PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

#### APPLICATIONS FOR PATENTS.

8002. John Pinnington, for "The Imperial patent sash frame."

8047. John Brayton, for "Improvements in window catches or fasteners."

8102. Aaron Wise, for "An improvement in fixing blinds to window-rollers, dispensing with tacks."

8116. Henry Gardiner Lloyd, for "London improvements in or relating to sewers, drains and the like."

8154. Frank Sheppard Holton and Thomas Smith Morley, for "An improved window frame and sashes."

8224. Frederick Elijah Blaisdell, for "An improved suspended platform or balcony for use on houses and other buildings."

8228. James Allen Haskett, for "Anti-rattling devices for windows."

8322. Alfred Julius Boulton, for "Improvements in or relating to chamber water-closet apparatus or commodes."

8339. John Bunt Willcock, Henry Curtis and William Stokes, for "Improvements in fire and other brick blocks."

8361. John Young and William Young, for "Ships' under-line pedestal water-closet."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & Co., Patent Agents, 73 Chancery Lane, London, W.C.

# THE NEW EXPANDED METAL

Meshes from  $\frac{1}{8}$ th in. to 6 in. wide. Strands from 24 B.W.G. to  $\frac{3}{16}$ th in. thickness of steel.

**FOR BUILDING CONSTRUCTION**, as supplied to a large number of important Buildings, both Public and Private, in this country and abroad.

**FOR SOLID PLASTER PARTITIONS**, 2 inches thick, with Expanded Metal Lathing. Fireproof, vermin-proof and practically sound-proof.

**FOR FIREPROOF LATHING**, for attaching to wooden joists and studs, for walls and ceilings, also for suspended ceilings, ornamental mouldings, encasing columns, girders, &c.—no cracking or falling away of plaster to be feared.

**FOR CONCRETE FLOORS WITH EXPANDED METAL**.—The remarkable results and advantages of these will be better understood by perusal of the Report hereinafter referred to.

**FOR EXTERIOR WALLS OF BUILDINGS**.—Cement applied to Expanded Metal is not liable to crack or fall away through changes of temperature.

**FOR FENCING, TREE GUARDS, WINDOW GUARDS**, as supplied to the Royal Parks, leading Railway Companies and landed Estates throughout the Kingdom.

**ORNAMENTAL. STRONG. CHEAP.**

**OTHER USES FOR EXPANDED METAL**.—These are innumerable. It can be used wherever lattice-work is required, from a letter-rack to a lift-shaft, for garden bordering and archways. Is highly ornamental and exceedingly durable, having no joints to rust away. Being expanded by rapid machinery it is considerably cheaper, strength for strength, than any other description of metal lattice-work.

**BRASS, ALUMINIUM**, or any other ductile metal can be expanded, and the effect is very pleasing, and here again the absence of joints gives great durability to the metal, and the rapidity of manufacture allows of very low prices.

**CATALOGUES AND PRICE LISTS** can be obtained on application. Also copy of a REPORT by an EMINENT FIRM of ENGINEERS on the use of EXPANDED METAL IN CONCRETE.

## EDITORIAL NOTICES.

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\*.\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

## NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

*For Advertisement Scale, see page xiii.*

## COMPETITION OPEN.

MORECAMBE.—Competitive designs are invited for the erection of a new hotel, to be called the Hôtel Métropole, at a cost of 30,000*l.*, at this picturesquely situated and rapidly increasing fashionable seaside resort. Designs must be sent in under motto on or before June 16, 1897.

## CONTRACTS OPEN.

ABERDEEN.—April 29.—For additions at the Manse of Udney. Messrs. Jenkins & Marr, architects, 16 Bridge Street, Aberdeen.

ADDLESTONE.—April 24.—For alterations and additions to Mountain Ash and 1 Richmond Villas, Station Road. Mr. Albert Veness, architect, Addlestone.

ANDOVER.—April 28.—For erection of buildings at the workhouse at Andover. Mr. A. Purkess, 16 Junction Road, Andover.

ARMAGH.—April 27.—For building Presbyterian church at Markethill. Messrs. J. J. Phillips & Son, architects, 61 Royal Avenue, Belfast.

ASHFORD.—May 7.—For new administrative block, addition to infirmary, new chapel and alterations to existing buildings, &c. Mr. Horace Hamilton, clerk, 11 Bank Street, Ashford.

BANGOR.—May 1.—For completion of the tower of St. Comgall's parish church. Mr. Stephens, building surveyor, Donegall Square Buildings.

BANSTEAD.—May 7.—For enlargement of the schoolrooms. Mr. Cecil Sharp, architect, 59 Fenchurch Street.

BARNESLEY.—April 29.—For alterations and additions to premises, Sheffield Road. Mr. Herbert Crawshaw, architect, 13 Regent Street, Barnesley.

BEESTON.—April 30.—For erection of Council offices. Mr. Hedley J. Price, architect and surveyor, 24 Low Pavement, Nottingham.

BISHOPS STORTFORD.—For plastering two eight-roomed houses. Messrs. J. L. Glasscock & Son, builders, Bishops Stortford.

BLACKBURN.—April 24.—For erection of a chimney 150 feet high, at the electricity works, Jubilee Street. Mr. E. M. Lacey, consulting engineer to the Corporation, 10 Delahay Street, Westminster.

BRADFORD.—April 27.—For erection of boundary-walls and clinker-crushing shed, including some millwright's work, at Cliffe Road destructor. Mr. George McGuire, town clerk, Bradford.

BRADFORD.—May 1.—For erection of two villas near Manningham Park. Mr. T. C. Hope, architect, Old Bank Chambers, Bradford.

BRISTOL.—April 26.—For building the Cabot memorial tower. Mr. Wm. V. Gough, architect, 24 Bridge Street, Bristol.

BUCHAREST.—May 18.—For construction of an industrial school at Jassy. Application to the Roumanian Ministry of Agriculture at Bucharest.

BURTON-UPON-TRENT.—April 27.—For extension of the borough accountant's department at the Town Hall. Mr. J. E. Swindlehurst, borough engineer and surveyor, Town Hall.

CARDIFF.—April 29.—For taking down the existing chimney-stack, with a portion of the flues, at Cogan Pumping Station, and the rebuilding of the chimney and flues in brickwork. Mr. C. H. Priestley, engineer, Town Hall, Cardiff.

CARDIFF.—May 3.—For the extension of Albany Road Board School. Mr. S. Rooney, architect, Cefn Mably Chambers, Quay Street, Cardiff.

CARLISLE.—For extensions and alterations at property of the South End Co-operative Society, Limited, Botchergate. Mr. T. Taylor Scott, architect, 43 Lowther Street, Carlisle.

CARLISLE.—For erection of six houses at Currock. Mr. J. B. Whitfield, Station Road, Workington.

CARNARVON.—April 26.—For erection of new chapel and schoolroom, for the committee of Siloh Independent Chapel, Chwillog. Mr. Elias Lloyd Jones, Post Office, Chwillog, R.S.O.

CARNARVON.—April 28.—For erection of Sunday school, classrooms and dwelling-house, &c. Mr. Robert O. Jones, Bryn Pistyll, Waenfawr.

CASTLEFORD.—April 28.—For erection of three terrace houses at Normanton Common. Mr. George F. Pennington, architect and surveyor, Bridge Street, Castleford.

CHARLTON.—May 4.—For erecting a shelter in gymnasium at Maryon Park, for the London County Council. Architect's Department, County Hall, Spring Gardens, S.W.

CHATHAM.—April 26.—For building town hall and municipal offices. Mr. G. E. Bond, architect, High Street, Rochester.

CHILWELL.—For erection of four shops at Chilwell. Mr. Ernest R. Ridgway, architect, Long Eaton.

CORNWALL.—April 28.—For erection of premises, for Messrs. Vivian Bros., at Market Place, Camborne. The proprietors, as above.

DARLINGTON.—May 3.—For science and art fittings for the technical college now in course of erection. Mr. F. T. Steavenson, town clerk, Houndgate, Darlington.

DARLINGTON.—April 26.—For erection of a Wesleyan Methodist Sunday school and other alterations at Gainford. Mr. Frank Martin, architect, West End Buildings, Skinnergate, Darlington.

DAVENTRY.—April 26.—For erecting six cottages on estate adjoining Warwick Street. Mr. J. B. Williams, architect, Moot Hall, Daventry.

DUNDEE.—April 26.—For erecting a brick building for the sanitary conveniences, Newport Pier. Mr. Geo. C. Buchanan, harbour engineer, Works Office, Harbour Chambers, Dundee.

ELGIN.—April 24.—For erection of farm steading, Aldroughy. Mr. Alex. Grant, architect, Inverness.

ELLAND.—April 26.—For erection of foundry, shed and offices at Perseverance Works. Mr. W. H. D. Horsfall, architect, &c., 9 Harrison Road, Halifax.

ESSEX.—April 24.—For erection of a detached eight-roomed house, small coachhouse and stable, near railway station, Wickford. Apply at Croft House, Wickford.

FAREHAM.—April 26.—For erection of a chaplain's residence at the Hants County Asylum. Messrs. Cancellor and Hill, architects, 12 Jewry Street, Winchester.

FARNHAM.—April 28.—For erection of men's casual wards upon land adjoining the workhouse. Mr. S. Stapley, architect West Street, Farnham.

FEATHERSTONE.—April 24.—For erection of two villas Messrs. Garside & Keyworth, architects and surveyors, Roper-gate, Pontefract.

FORDINGBRIDGE.—April 24.—For erection of a farmhouse at Burgate. Mr. Reginald Hannen, steward of the manor of Burgate.

GATESHEAD.—April 30.—For erection of shops and houses in High Street. Mr. Armour, West Street, Gateshead.

GILDERSOME.—April 26.—For erection of fence-walls to Park Field Villa. Mr. T. A. Buttery, architect, Queen Street, Morley.

GLOUCESTER.—May 4.—For erection of a cottage at Barber's Bridge Station. Mr. G. K. Mills, secretary, G.W.R., Paddington Station, London.

GREAT YARMOUTH.—May 4.—For alterations at the Free Library, for the Free Library committee. Mr. J. Wm. Cockrill, borough surveyor, Town Hall, Great Yarmouth.

HALIFAX.—May 12.—For erection of stables, cart-sheds, &c., at Washer Lane Dyeworks. Messrs. Chas. F. L. Horsfall & Son, architects and surveyors, Lord Street Chambers, Halifax.

HALIFAX.—April 28.—For the various works required in erection of a Catholic church, &c., at Denholm, Luddenden Foot. Mr. W. Wrigley, architect and surveyor, Crossley Terrace, Hebden Bridge.

HALIFAX.—April 28.—For erection of a Catholic church, &c., at Denholm, Luddenden Foot. Mr. W. Wrigley, architect and surveyor, Crossley Terrace, Hebden Bridge.

HALIFAX.—April 27.—For taking down the Barrack Tavern and other buildings, &c., in Charles Street and Causeway, in the borough of Halifax, and erecting upon the site additions to the premises of the Automatic Standard Screw Company. Messrs. Jackson & Fox, architects, 22 George Street, Halifax.

HANWELL.—May 10.—For erection of temporary iron structures at the Asylum. Mr. R. W. Partridge, clerk of the Asylums Committee, 21 Whitehall Place, S.W.

HARTING.—May 15.—For enlargement of schools. Mr. C. Taylor, South Harting.

HARTLEPOOL.—May 11.—For conversion into coastguard dwellings, battery, &c., of buildings formerly used as militia barracks. R.N.R. Battery, West Hartlepool.

HENDON, N.W.—May 10.—For erection of an asylum. Messrs. Giles, Gough & Trollope, architects, 28 Craven Street, Strand, W.C.

HIGH SPEN.—April 30.—For erection of twelve two-roomed cottages. Mr. Thomas Ramsay Ramsay, 42 Mosley Street, Newcastle-on-Tyne.

HUDDERSFIELD.—May 6.—For erection of a villa residence, with surgery attached, near Riding Wood, Clayton West. Messrs. John Kirk & Sons, architects, Huddersfield.

ILLINGWORTH.—May 4.—For erection of a detached house in Raw Lane. Mr. Medley Hall, architect and surveyor, 29 Northgate, Halifax.

IRELAND.—For building of walls of addition to store at Ballinacurra. Mr. John H. Bennett, The Maltings, Ballinacurra.

JARROW.—April 28.—For alterations and additions to the higher-grade school. Mr. George Mason, clerk, School Board Offices, Jarrow.

KEIGHLEY.—April 24.—For erection of shop, &c., in Lawkholme Lane. Messrs. W. H. & A. Sugden, architects, Cavendish Street, Keighley.

KEIGHLEY.—April 27.—For addition to Albert Foundry. Messrs. W. & J. B. Bailey, architects, Bradford and Keighley.

KENDAL.—May 1.—For erection of Victoria mills and offices in Sandes Avenue. Mr. Robert Walker, architect, Windermere.

KIRTON.—April 26.—For works to the nave of Kirton Church, near Boston. Mr. C. Hodgson Fowler, The College, Durham.

LANCASTER.—May 5.—For alterations at the slaughter-houses and cattle auction mart. Mr. T. Cann Hughes, town clerk, Town Hall, Lancaster.

LANCASTER.—May 8.—For erection of a mixed school, with offices, &c., in Bowerham Lane. Mr. Herbert D. Wilson, clerk, 85 Church Street, Lancaster.

LARNE.—April 29.—For erection of National schools, Kilwaughter. Mr. Samuel P. Close, architect, 53 Waring Street, Belfast.

LEICESTER.—April 30.—For the construction of a concrete and stone bridge over the Leicestershire and Northamptonshire Union Canal and Flood Course, and for the formation of a new road from the Newarke to the Western Boulevard, together with a storm overflow, foul and storm-water sewers, and other works in connection therewith. Mr. E. Geo. Mawbey, C.E., borough surveyor, Town Hall, Leicester.

LIVERPOOL.—April 26.—For taking down their present stand and erection of a new grand stand for the Everton Football Club Company, Limited. Mr. Henry Woodhouse, architect, 19 Sir Thomas Street, Liverpool.

LLANGOLLEN.—April 26.—For erection of County School. Mr. H. Feather, architect, Andrew's Buildings, Queen Street, Cardiff.

LONDON.—May 10.—For erection of temporary iron structures at Hanwell Asylum, W. Mr. R. W. Partridge, clerk of the Asylums Committee, 21 Whitehall Place, S.W.
